Photoelectric Effects In Semiconductors / Fotoelektricheskie Yavleniya V Poluprovodnikakh /

Фотоэлектрические Явления В Полупроводниках Solomon M. Ryvkin, 1964-09 Investigations of photoelectric effects occupy an important place in studies of semiconductors Recently investigations of photoconductivity and photoelectromotive forces have been intensified in step with the general development of semiconductor physics An important feature of current work is an approach which combines several experimental methods of investigating photoconductivity by measuring a number of the parameters which govern it e g quantum yield lifetime etc In other words the study of steady state photoconductivity is being replaced by the study of photoconductivity kinetics Another important feature is the extension of the studies beyond purely photoelectric phenomena by the use of radiations other than light Such an extension is justified not only by practical requirements but also by the close similarity between the ionization processes produced by different radiations It can be shown that the charge carriers liberated by light and other radiations are not unique as far as their behavior in a crystal lattice is concerned This can be seen from the following considerations *Photoelectric Effects in Semiconductors* Solomon Meerovich Ryvkin, 1969 Radiation Effects in Semiconductors Krzysztof Iniewski, 2018-09-03 Space applications nuclear physics military operations medical imaging and especially electronics modern silicon processing are obvious fields in which radiation damage can have serious consequences i e degradation of MOS devices and circuits Zeroing in on vital aspects of this broad and complex topic *Radiation Effects in Semiconductors* addresses the ever growing need for a clear understanding of radiation effects on semiconductor devices and circuits to combat potential damage it can cause Features a chapter authored by renowned radiation authority Lawrence T Clark on Radiation Hardened by Design SRAM Strategies for TID and SEE Mitigation This book analyzes the radiation problem focusing on the most important aspects required for comprehending the degrading effects observed in semiconductor devices circuits and systems when they are irradiated It explores how radiation interacts with solid materials providing a detailed analysis of three ways this occurs Photoelectric effect Compton effect and creation of electron positron pairs The author explains that the probability of these three effects occurring depends on the energy of the incident photon and the atomic number of the target The book also discusses the effects that photons can have on matter in terms of ionization effects and nuclear displacement Written for post graduate researchers semiconductor engineers and nuclear and space engineers with some electronics background this carefully constructed reference explains how ionizing radiation is creating damage in semiconducting devices and circuits and systems and how that damage can be avoided in areas such as military space missions nuclear applications plasma damage and X ray based techniques It features top notch international experts in industry and academia who address emerging detector technologies circuit design techniques new materials and innovative system approaches *Photoelectric Effects in Semiconductors* Solomon Meerovič Ryvkin (Physicien, Union Soviétique), 1969 **Semiconductor Physical**
