It is organized by the Quantum Electronics Divisional Board of the European Physical Society E P S and held at the Villa of Poggio Imperiale in Florence September 3-6 1979 As known laser surgery especially microsurgery and endoscopic photo coagulation has recently made important progress and the field is expanding rapidly Very significant applications of lasers have also been achieved in Biology during recent years cell microsurgery cell counting and sorting cytofluorimeter devices etc and the potential of laser techniques in this field is now sufficiently well established A new class of applications of laser radiation in Medicine has recently been made possible by important results obtained with low intensity non coagulative visible lasers such as photodynamic therapy of tumors At the same time important branches of Medicine where light effects are studied and optical techniques are presently used for a certain number of clinical applications such as dermatology and pediatrics appear to be still in their infancy as far as the proper use of optical radiation and techniques and the understanding of fundamental photoinduced biological processes are concerned Moreover laser photobiology appears a very promising field for the investigation of fundamental processes at the biomolecular level

Photomedicine in Gynecology and Reproduction P. Wyss, Y. Tadir, B. J. Tromberg, U. Haller, 2000-03-02 The photodynamic technique involves the administration of a photosensitizer followed by application of laser light When light interacts intracellularly with the photosensitizer the photon energy absorbed by the sensitizing molecule mainly generates photooxidation for tissue destruction or fluorescence for diagnostics Photomedical techniques provide a minimally invasive ambulatory procedure in gynecology not needing anesthetics A history of photomedicine explains the main elements and mechanisms of photomedical techniques One of the main chapters is dedicated to the biochemical and biophysical aspects of photomedicine such as characterization of photosensitizers their interaction with light their destruction the optical dosimetry and optical properties of tissues The clinical part of this book summarizes the state of the art activity in all major gynecologic applications from cervix to breast and provides the reader with an understanding of photodynamic therapy and basic mechanisms Photon assisted reproduction e.g. laser assisted fertilization embryo hatching and prenatal diagnosis makes up the final chapters Belonging in every hospital or university library this book underscores why photomedicine appeals to such a broad spectrum of students basic scientists clinicians and members of the corporate world

The Science of Photomedicine J.D. Regan, 2012-12-06 Although the history of photomedicine dates back thousands of years with even preliterate cultures appreciating the healing properties of sunlight for many workers in the discipline photomedicine is associated with the observation about 100 years ago of Niels Finsen a Danish physician Finsen recognized that people with tuberculosis who lived in Norway and who had very little exposure to sunlight often developed facial lesions lupus vulgaris which would decrease and sometimes disappear during the summer months This very observant physician reasoned that artificial light ought to produce the same effect as sunlight and began utilizing the radiation from the newly available carbon arc At first he used a glass lens to concentrate the radiation but since this produced considerable burning he replaced this with a hollow glass lens filled with water However while this reduced the heat burns it did not actually duplicate the effect of direct sunlight Finally using a hollow lens filled with water but equipped with quartz windows Finsen was able to imitate even improve upon the effect of sunlight As a result lupus vulgaris was practically eliminated from the Scandinavian countries Journal of Computational and Theoretical Nanoscience, 2004 *ACS(I) Textbook on Cutaneous & Aesthetic Surgery* Mysore Venkataram, 2017-07-17 The new edition of this two volume set has been fully revised to provide dermatosurgeons with the latest developments and techniques in the field The book has been expanded to eighteen sections and 152 chapters all falling under subspecialties of dermatosurgery aesthetics lasers and practice management Each technique includes discussion on historical background indications contraindications instrumentation procedures adverse effects complications and references The second edition features 81 new chapters on topics such as body shaping microneedle RF new laser and energy technologies platelets rich plasma regional surgeries and training in dermatosurgery The text is enhanced by nearly 2000 clinical photographs and diagrams and also includes text boxes tables and keynotes in each chapter Key points Fully revised second edition of two volume set providing latest techniques in cutaneous and aesthetic surgery Expanded text with 81 new chapters Features nearly 2000 clinical photographs and diagrams Previous edition 9789350258903 published in 2012 The Science of Phototherapy Leonard I. Grossweiner, 1994-09-22 The Science of Phototherapy reviews the current status of established and emerging phototherapies including recent information about the mechanisms of action The major topics are developed from basic principles in order to be most useful to readers with different backgrounds The book describes the operation of phototherapy instrumentation including conventional and laser

light sources photodetectors radiometers and optical fibers and features a comprehensive treatment of tissue optics ranging from basic principles to clinical applications The applications of phototherapy to light dosimetry optical diagnosis and laser surgery are further developed with worked examples and the more quantitative topics are explained with the use of illustrations The book includes an extensive bibliography
