

The kinematics of stars in E galaxies

Stars in E galaxies do not follow ordered motions, but most of their kinetic energy is in the form of random motions. Moreover, the more luminous an E, the larger the velocity dispersion (which, as we have seen can be used to derive distances to E).

To measure the orbital velocities of stars within galaxies is a difficult task. Absorption lines are used, which are the result of the light of all stars. Each star emits a spectrum which is Doppler shifted in wavelength according to its motion. This orbital motion makes the resulting spectral lines be wider than those of an individual star.

Photometry, Kinematics, and Dynamics of Galaxies David Stanley Evans, 1979 **Dynamics of Galaxies** Giuseppe Bertin, 2000-06-12 Our understanding of galaxies has advanced significantly in recent years New observations from ground and space based telescopes the discovery of dark matter and powerful computer simulations have been instrumental in this This textbook provides graduate students with a complete and thorough introduction to galactic dynamics The first two parts of the book define the astrophysical problems and the methods for building sound physical models Next the observational properties and models of spiral then elliptical galaxies are examined in detail Finally a selection of exciting topics from contemporary research are introduced including the formation and evolution of galaxies cooling flows accretion disks and galaxies at high redshift Throughout the emphasis is on developing a clear understanding and good physical intuition of the processes involved Full derivations are provided for key results and helpful problems are included This textbook provides graduate students with a self contained and accessible introduction to modern galactic dynamics *Photometry, Kinematics, and Dynamics of Galaxies* David Stanley Evans, 1979 **Photometry, Kinematics, and Dynamics of Galaxies** David Stanley Evans, 1979 **PHOTOMETRY, KINEMATICS AND DYNAMICS OF GALAXIES** D.S. excluding the three for which identification atlases are already in print and shows the most important objects including many thousands of individual stars and interstellar objects. It is unique in its coverage and format and provides a source of these fundamental data that will be used for many years. Researchers, students and even amateur astronomers will be able to use the Atlas to identify and study the various components of the nearly 30 important galaxies covered by the Atlas. The objects identified on the more than 200 charts include variable stars, globular star clusters, open star clusters, stellar associations, emission regions, supernova remnants, planetary nebulae and dust clouds. Each galaxy is accompanied by an extensive bibliography.

Morphological and Physical Classification of Galaxies G. Longo, Massimo Capaccioli, G.

Busarello, 1992-05-31 The morphological scheme devised by Hubble and followers to classify galaxies has proven over many decades to be quite effective in directing our quest for the fundamental parameters describing the extragalactic manifold. This statement is however far more true for spirals than for ellipticals. Echoing the concluding remarks in Scott Tremaine's summary talk at the Princeton meeting on Structure and Dynamics of Elliptical Galaxies, the Hubble classification of spirals is useful because many properties of spirals, gas content, spiral arm morphology, bulge prominence, etc., all correlate with Hubble type. By contrast, almost nothing correlates with the elliptical Hubble sequence, E1 to E7. During the last few years, much effort has been put into the search for a more meaningful classification of ellipticals than Hubble's. Concomitantly, forwarded by some provocative conjectures by R. Michard, the classical question of whether E galaxies form a physically homogeneous family has been brushed up once more. Results of these and other parallel studies look rather promising and point to suture part of the dichotomy between ellipticals and disk galaxies which had become popular in the early eighties owing to dynamical arguments. At the same time, it appears more and more clear that besides the usual genetic varieties of galaxies, products of environmental evolution must also be contemplated in building our modern picture of the reign of galaxies. The above considerations prompted us to solicit Prof.

The World of Galaxies Harold G. Corwin, Lucette Bottinelli, 2012-12-06 From 12 April to 14 April 1988 120 of Gerard and Antoinette de Vaucouleurs's friends and colleagues gathered at the Institut d'Astrophysique in Paris to celebrate Gerard's 70th birthday and his remarkable career in Astronomy. The gathering also honored the memory of Antoinette who died 29 August 1987 after a long illness and her own no less remarkable career. This volume collects the 24 invited review papers and the 60 contributed poster papers presented at the meeting. Gerard de Vaucouleurs was born on 25 April 1918 in Paris where he spent his boyhood. He became an active amateur astronomer in the early 1930s making extensive observations of Mars, Jupiter and variable stars including the bright supernova of 1937 in IC 4182. He also began life-long interests in astronomical photography and galaxy cataloguing during this period. In 1939 he met the director of the Paris transport system and an equally avid amateur astronomer, Julien Peridier. De Vaucouleurs worked at Peridier's private observatory at Le Houga in southwestern France on and off throughout the next decade. His undergraduate work was in mathematics, astronomy and experimental physics; this

combined with his interest in observational astronomy formed his life long empirical approach to science After spending 18 months in the French army early in 1939 41 Gerard returned to the Peridier observatory and then in 1943 to his studies at the Sorbonne where he met Antoinette
