number of coexisting species were correlated with changes in abundance and size distribution of their prey surface dwelling fishes *The Taxonomy, Systematics, and Zoogeography of Hypsibarbus, a New Genus of Large Barbs (Pisces, Cyprinidae) from the Rivers of Southeastern Asia* Walter J. Rainboth, 1996-01-01 In this study the author describes *Hypsibarbus* a new genus of Asian cyprinid fishes with twelve species three of them new A complete set of 45 measurements and 17 counts was taken and analyzed for approximately 250 specimens including all type material of more than 1000 specimens encountered representing most of the major fish collections of the world The author fully redescribes and illustrates all species in the new genus and includes keys for their identification To provide a basis for understanding zoogeographic implications of the phylogeny obtained for *Hypsibarbus* the geography and history of the Southeast Asia river basins is discussed in detail

collection of selected papers that explore this marvelous biological abundance The book is divided into six parts The first section sets the stage with geological and paleobotanical overviews the succeeding five sections employ a strong taxonomic base to document species richness endemism and distribution for animals and plants followed by reviews of contrasting ecosystems and plants that are closely associated with humans The last section summarizes the disheartening rate of habitat destruction which threatens to diminish this diversity In addition to the purely scientific value of this important work it provides the much needed basic data that will help conservation policymakers assess and respond to Mexico s ecological evolution
