Chapter 6- Section A

- Nervous system is divided into 2 parts:
 - **Central nervous system**= brain and spinal cord
 - **Peripheral nervous system**= nerves connecting muscles, glands, sense organs, and other tissue to the CNS
- **Neuron**: functional unit of the nervous system
- **Neurotransmitters**: chemical messengers released by the electrical signals of neurons that communicate with other cells
- Most neurons serve as integrators because their output reflects the balance of input they receive from many, many other neurons
- Most neurons contain this basic structure: cell body and two types of processes: dendrites and axons.
- **Soma (cell body)**: contains nucleus and ribosomes, therefore, genetic material and capability for protein synthesis
- **Dendrites**: series of highly branched outgrowths of the cell that receive incoming information from other neurons
 - Increase neurons surface area
 - Increase the cell's capacity to receive signals from many other neurons
- **Dendritic spines**: knoblike outgrowths that increase the surface area of dendrites still further
- **Axon**: a long process that extends from the cell body and carries outgoing signals to its target cells
- **Axon hillock**: the region of the axon that arises from the cell body
 - This is the area in most neurons where electrical signals are generated
- **Collaterals**: branches on the axon
 - The axon and collaterals still further divide; the greater a neuron branches, the greater its sphere of influence
- **Axon terminals**: ends of axon branches that are responsible for releasing neurotransmitters
 - Alternatively, some neurons release neurotransmitters from bulging areas in the axon called **varicosities**
- **Myelin**: highly modified plasma membranes that cover the axon in many layers and speed up the conduction of action potentials as well as conserve energy
- **Oligodendrocytes**: the glial cells in the CNS that produce myelin
 - NOT a 1:1 ratio; oligodendrocytes can cover sometimes up to 40 neurons
- **Schwann cells**: cells that produce myelin in the PNS
 - Produced in small segments, at regular intervals on some neurons
- **Nodes of Ranvier**: the spaces between adjacent sections of myelin where the axon's plasma membrane is exposed to ECF, where action potentials are regenerated
