Fourteen authoritative reviews cover the predictions of warming rates by General Circulation Models variabilities in atmospheric circulation and moisture flux the dynamics of the polar vortex in the Arctic and its role in ozone loss the countervailing influence of air pollution in reducing solar irradiance and the impact of climatic change on Arctic terrestrial and marine ecosystems Also detailed are the thermohaline circulation of the ocean the extent and thickness of sea ice the sizes of glaciers and ice sheets and the extent of permafrost Moving to past changes the records from Greenland ice cores and deep ocean drilling are reviewed for what they tell us about past climates and glaciation in the Arctic The book paints a vivid and disturbing picture of the enhanced warming that can be expected in the Arctic relative to lower latitudes and of the major impacts that this will have on the northern cryosphere It will be an invaluable reference for anyone seeking a greater understanding of the factors and processes affecting the arctic environment which may ultimately have a major impact on global climatic change
