Structured Query Language (SQL) Akeel I. Din,1994 The Structured Query Language SQL has emerged in recent years as the standard query language used with relational databases The SQL language has gained ANSI American National Standards Institute and ISO International Standards Organisation certification and a version of SQL is available for almost any computer system from a Cray supercomputer to a PC There is now a growing need for a clear basic introduction to SQL and its applications The author sets the scene with an introduction to relational databases and a brief history of the development of SQL The language is then presented in an overview chapter which describes the functions of the major SQL commands and gives the reader an idea of the power of the language in creating populating querying and modifying database tables Later chapters focus on explaining each of the SQL command groups more fully The order of topics is carefully chosen as many SQL commands build upon others **Standard Relational and Network Database Languages** E.J.

Yannakoudakis,C.P. Cheng,2012-12-06 For any type of software to become standard whether a third generation language or an integrated project support environment IPSE it must undergo a series of modifications and updates which are a direct result of theoretical and empirical knowledge gained in the process The database approach to the design of general purpose information systems has undergone a series of revisions during the last twenty years which have established it as a winner in many different spheres of information processing including expert systems and real time control It is now widely recognised by academics and practitioners alike that the use of a database management system DBMS as the underlying software tool for the development of information knowledge based systems can lead to environments which are a flexible b efficient c user friendly d free from duplication and e fully controllable The concept of a DBMS is now mature and has produced the software necessary to design the actual database holding the data The database languages proposed recently by the International Organisation for Standardisation ISO are thorough enough for the design of the necessary software compilers i e programs which translate the high level commands into machine language for fast execution by the computer hardware The ISO languages adopt two basic models of data and therefore two different sets of commands a the relational implemented via the relational database language RDL and b the network implemented via the network database language NDL *Introduction*
