Dynamic Approaches to Phonological Processing Hunter Hatfield, 2023-05-11 Natural language occurs in time Events happen earlier later or simultaneously with other events however this temporal dimension is often downplayed or overlooked This Element introduces readers with a background in structural linguistics to dynamic approaches to phonological processing It covers models of serial order speech production and speech perception with special attention to how they can enhance one another The work then asks whether dynamic approaches have the potential to change how we think of phonological structure Key ideas discussed include phonemes and auditory targets control mechanisms creating structure and the shape of phonological representations in a dynamic context The work should function as a bridge for those with linguistic questions who want to learn answers derived from the study of speech as a dynamic system Speech Production Jonathan Harrington, Marija Tabain, 2013-05-13 *Speech Production Models Phonetic Processes and Techniques* brings together researchers from many different disciplines computer science dentistry engineering linguistics phonetics physiology psychology all with a special interest in how speech is produced From the initial neural program to the end acoustic signal it provides an overview of several dominant models in the speech production literature as well as up to date accounts of persistent theoretical issues in the area A particular focus is on the evaluation of information gleaned from instrumental investigations of the speech production process including MRI PET ultra sound video imaging EMA EPG X ray computer simulation and many others The research presented in this volume considers questions such as the feed back vs feed forward control of speech the acoustic auditory vs articulatory somato sensory domains of speech planning the innateness of human speech the possible architecture of a speech production model and the realization of prosodic structure in speech Leaders in speech research from around the world have contributed their most recent work to this volume **Gesture, Segment, Prosody** Gerard J. Docherty, D. Robert Ladd, 1992-05-14 *Laboratory Phonology* uses speech data to research questions about the abstract categorical structures of phonology This collection of papers broadly addresses three such questions what structures underlie the temporal coordination of articulatory gestures What is the proper role of segments and features in phonological description And what structures hierarchical or otherwise relate morphosyntax to prosody In order to encourage the interdisciplinary understanding required for progress in this field each of the three groups of papers is preceded by a tutorial paper commissioned for this volume on theories and findings presupposed by some or all of the papers in the group In addition most of the papers are followed by commentaries written by noted researchers in phonetics and phonology which serve to bring important theoretical and methodological issues into perspective Most of the material collected here is based on papers presented at the Second Conference on Laboratory Phonology in Edinburgh 1989 The volume is therefore a sequel to Kingston and Beckman's *Papers in Laboratory Phonology I* also published by Cambridge

University Press Dynamic Speech Models Li Deng, 2022-05-31

Speech dynamics refer to the temporal characteristics in all stages of the human speech communication process. This speech chain starts with the formation of a linguistic message in a speaker's brain and ends with the arrival of the message in a listener's brain. Given the intricacy of the dynamic speech process and its fundamental importance in human communication, this monograph is intended to provide a comprehensive material on mathematical models of speech dynamics and to address the following issues: How do we make sense of the complex speech process in terms of its functional role of speech communication? How do we quantify the special role of speech timing? How do the dynamics relate to the variability of speech that has often been said to seriously hamper automatic speech recognition? How do we put the dynamic process of speech into a quantitative form to enable detailed analyses? And finally, how can we incorporate the knowledge of speech dynamics into computerized speech analysis and recognition algorithms? The answers to all these questions require building and applying computational models for the dynamic speech process. What are the compelling reasons for carrying out dynamic speech modeling? We provide the answer in two related aspects. First, scientific inquiry into the human speech code has been relentlessly pursued for several decades. As an essential carrier of human intelligence and knowledge, speech is the most natural form of human communication. Embedded in the speech code are linguistic as well as para-linguistic messages which are conveyed through four levels of the speech chain. Underlying the robust encoding and transmission of the linguistic messages are the speech dynamics at all the four levels. Mathematical modeling of speech dynamics provides an effective tool in the scientific methods of studying the speech chain. Such scientific studies help understand why humans speak as they do and how humans exploit redundancy and variability by way of multitiered dynamic processes to enhance the efficiency and effectiveness of human speech communication. Second, advancement of human language technology, especially that in automatic recognition of natural style human speech, is also expected to benefit from comprehensive computational modeling of speech dynamics. The limitations of current speech recognition technology are serious and are well known. A commonly acknowledged and frequently discussed weakness of the statistical model underlying current speech recognition technology is the lack of adequate dynamic modeling schemes to provide correlation structure across the temporal speech observation sequence. Unfortunately, due to a variety of reasons, the majority of current research activities in this area favor only incremental modifications and improvements to the existing HMM-based state of the art. For example, while the dynamic and correlation modeling is known to be an important topic, most of the systems nevertheless employ only an ultra-weak form of speech dynamics, e.g., differential or delta parameters. Strong form dynamic speech modeling, which is the focus of this monograph, may serve as an ultimate solution to this problem.

After the introduction chapter, the main body of this monograph consists of four chapters. They cover various aspects of theory, algorithms, and applications of dynamic speech models and provide a comprehensive survey of the research work in this area spanning over past 20 years. This monograph is intended as advanced materials of speech and signal processing for graduate

level teaching for professionals and engineering practitioners as well as for seasoned researchers and engineers specialized in speech processing Dental Research in the United States and Other Countries ,1978 A catalog of dental research projects sponsored by federal and non federal organizations The effect of hearing loss on neural processing Jonathan E. Peelle, Arthur Wingfield, 2015-06-03 Efficient auditory processing requires the rapid integration of transient sensory inputs This is exemplified in human speech perception in which long stretches of a complex acoustic signal are typically processed accurately and essentially in real time Spoken language thus presents listeners auditory systems with a considerable challenge even when acoustic input is clear However auditory processing ability is frequently compromised due to congenital or acquired hearing loss or altered through background noise or assistive devices such as cochlear implants How does loss of sensory fidelity impact neural processing efficiency and health How does this ultimately influence behavior This Research Topic explores the neural consequences of hearing loss including basic processing carried out in the auditory periphery computations in subcortical nuclei and primary auditory cortex and higher level cognitive processes such as those involved in human speech perception By pulling together data from a variety of disciplines and perspectives we gain a more complete picture of the acute and chronic consequences of hearing loss for neural functioning **The Routledge Handbook of Phonetics** William F. Berthier, 2017-03-23 Language learning also implies the acquisition of a set of phonetic rules and prosodic contours which define the accent in that language While often considered as merely accessory accent is an essential component of psychological identity as it embodies information on origin culture and social class Speaking with a non standard foreign accent is not inconsequential because it may negatively impact communication and social adjustment Nevertheless the lack of a formal definition of accent may explain that as compared with other aspects of language it has received relatively little attention until recently During the

past decade there has been increasing interest in the analysis of accent from a neuroscientific perspective This e book integrates data from different scientific frameworks The reader will find fruitful research on new models of accent processing how learning a new accent proceeds and the role of feedback on accent learning in healthy subjects In addition information on accent changes in pathological conditions including developmental and psychogenic foreign accent syndromes as well as the description of a new variant of foreign accent syndrome is also included It is anticipated that the articles in this e book will enhance the understanding of accent as a linguistic phenomenon the neural networks supporting it and potential interventions to accelerate acquisition or relearning of native accents

Empirical Approaches to the Phonological Structure of Words Christiane Ulbrich,Alexander Werth,Richard Wiese,2018-03-19 One of the basic grammatical categories in linguistics is the phonological word But how are words made up in terms of their sounds And how is the information on the sound structure of words used in the processing of words The multidimensionality of the phonological word relates it to semantics morphology phonology and syntax It is nevertheless a category that has only been an object of serious study since the prosodic turn in phonology and thus cannot be considered an established category of grammatical description This volume brings together scholars interested in the complex relations of the phonological word applying different empirical approaches

Handbook Of Pattern Recognition And Computer Vision (5th Edition) Chi Hau Chen,2015-12-15 Pattern recognition image processing and computer vision are closely linked areas which have seen enormous progress in the last fifty years Their applications in our daily life commerce and industry are growing even more rapidly than theoretical advances Hence the need for a new handbook in pattern recognition and computer vision every five or six years as envisioned in 1990 is fully justified and valid The book consists of three parts 1 Pattern recognition methods and applications 2 Computer vision and image processing and 3 Systems architecture and

technology This book is intended to capture the major developments in pattern recognition and computer vision though it is impossible to cover all topics The chapters are written by experts from many countries fully reflecting the strong international research interests in the areas This fifth edition will complement the previous four editions of the book
