**Simultaneous Biological Nitrogen Removal and Electrochemical Phosphorus Recovery from Municipal Wastewater** Damian Jakub Kruk, 2017 The main objective of the study was to develop a partial nitrification anammox electrically assisted struvite yield membrane bioreactor. A EASY MBR with simultaneous phosphorus recovery for treatment of municipal wastewater. The research was conducted in four separate experiments evaluating the feasibility of electrochemical phosphorus recovery, impact of electric current on nitrifying and anammox bacteria, and long term anammox performance at low temperature. The EASY method based on the magnesium dissolution from a sacrificial anode was found to be very effective in recovery of high quality struvite even from fermented waste activated sludge from a wastewater treatment plant that does not practice enhanced biological phosphorus removal. Effects of short and long term exposure of nitrifying biomass to direct current were investigated using inert graphite electrodes. Both short and long term exposure

kinetic tests indicated that the activity of ammonia oxidizing bacteria was slightly inhibited with almost linear decline whereas the activity of nitrite oxidizing bacteria was stimulated. The trends of relative activity changes exhibit a high correlation to the electric current applied per mass of volatile suspended solids. Low temperatures are one of the main obstacles to implementation in the main stream. In this study the impact of long term exposure to a temperature of 10 °C on the anammox process was investigated. Quantitative PCR was used to follow the population dynamics of different strains of anammox bacteria. Results of the investigation of the electric current impact on anammox activity provided evidence that simultaneous anammox and electrochemical processes is not a feasible approach. However the study provided a novel method of phosphorus recovery available also for non EBPR plants which can be applied in the mainstream process simultaneously with conventional nitrification. The study of anammox at low temperature generated valuable insights for development of mainstream anammox treatment.

**Removal of Nitrogen and Phosphorus from Municipal Wastewater using Microalgae immobilized on Twin-Layer System** Jing Shi, 2010-12-09 Excessive nitrogen and phosphorus loading from municipal wastewater treatment plants is an ongoing threat to water quality which leads to more stringent environmental regulations in different countries. Microalgal mediated twin layer system offers an interesting alternative for nitrogen and phosphorus removal since it provides a treatment to remove both nutrients efficiently coupled with the production of potentially valuable biomass. In the twin layer system microalgae are immobilized by self adhesion on a wet microporous ultrathin substrate. Subtending the substrate layer a second layer consisting of a macroporous fibrous material the source layer provides the growth medium. Twin layer effectively separates microalgae from the bulk of their growth medium yet allows diffusion of nutrients. Nylon filter cloth and glass grid reinforced lamina were selected as the suitable substrate and source layer for twin layer system respectively. Immobilized green algae *Scenedesmus rubescens* and *Chlamydomonas terricola* showed highest biomass productivities among 23 algae supplied by synthetic secondary wastewater and were recommended for wastewater treatment in general. Removal of nitrogen and phosphorus from the real municipal wastewater by *S. rubescens* was investigated. During 54 days *S. rubescens* grew well. 1.05 g dry weight m<sup>-2</sup> day<sup>-1</sup> remained immobilized and removed phosphorus, nitrate and ammonium efficiently from four types of wastewater within short retention time. 1-2 days e.g. the residual phosphate P was

Optimization of Biological Nitrogen and Phosphorus Removal in A2/O Wastewater Treatment Processes Changyong Wu, 2021 Anaerobic anoxic oxic A2 O is one of the most widely used processes in municipal wastewater treatment plants for simultaneous biological nitrogen and phosphorus removal The A2 O process has many advantages such as simple configuration and short hydraulic retention time HRT etc In addition it is easy to operate Therefore A2 O will be continuously chosen as the main option in all kinds of newly designed and built wastewater treatment plants Though the A2 O process has been used widely it has some inherent contradictions which are difficult to overcome For example the contradiction between substrate competition and SRT makes the high nitrogen and phosphorus removal unable to be achieved simultaneously As a

result the removal efficiency of the system cannot be further improved In the past 10 years in China the wastewater quality very obviously changed with the improvement of living conditions At present municipal wastewater with a low C N ratio is rather common in most countries in the world The lack of a carbon source will make the inherent contradictions of the A2 O process becomes serious Therefore the conventional design parameters of the A2 O process are needed to adjust or the configuration of the A2 O process should change to fit the change of the wastewater quality According to this this book systematically describes how to improve the nitrogen and phosphorus removal efficiency of municipal wastewater with low C N ratio and effectively utilize the carbon resource in the influent of wastewater This publication is useful for students researchers and engineers whose major focus is municipal and the environment
