The Rhabdoviruses Robert R. Wagner, 2013-06-29 The viruses of the family Rhabdoviridae have an exceedingly broad host range and are widely distributed throughout the animal and plant kingdoms Animal rhabdoviruses infect and often cause disease in insects fish and mammals including man The prototype rhabdovirus vesicular stomatitis virus VSV has been extensively studied and provides perhaps the best model system for studying negative strand viruses The popularity of VSV as a model system is to a considerable extent due to its relative simplicity and to its rapid growth generally to high titer in many cell types ranging from yeast to human The nucleocapsids of these viruses also carry transcriptional and replicative functions that are expressed in cell free systems The first RNA dependent RNA polymerase was described in VSV and its G protein provided an early model system for studying the synthesis processing and membrane insertion of mammalian glycoproteins VSV is also highly cytopathogenic and has been studied quite extensively for its capacity to kill cells and to shut off cellular macromolecular synthesis Even earlier VSV was discovered to be highly susceptible to the action of interferons and has served ever since as a means for quantitating the activity of interferons To my way of thinking the spark that ignited the explosion of research in this field was struck at the First International Colloquium on Rhabdoviruses attended by 30 or so participants in Roscoff France in June 1972

New Trends and Developments in Vaccines A. Voller, C.M. Abraham, 2012-12-06 It was not too long ago that many physicians and biomedical scientists felt that the era of vaccines for protecting mankind against infectious disease was coming to an end During the 1940s and 50s the widespread use of newly developed antibiotics and antimicrobial chemotherapeutic agents suggested a new era in medicine i.e. the control and eventual elimination of all infectious diseases at least those caused by bacteria by chemical means The magic bullet proposed by Paul Ehrlich in the early 1900s seemed to be the method of choice for controlling infection However it is now quite evident that those high expectations were unwarranted Although many acute infections especially those caused by pyogenic cocci have been controlled by antibiotics it is quite evident that infectious diseases even those caused by bacteria still are a major problem Thus the old standby of preventative vaccination is making a strong comeback not only for viral but also for bacterial infections However except for a relatively small number of viral diseases and those bacterial diseases due to toxin elaborated by microorganisms rather than invasion and replication of the microbe per se preventative vaccination still has not fulfilled the expectations of their proponents There has been a recent resurgence of interest

concerning all aspects of vaccines not only their preparation and administration but also the nature and mechanism of the host immune response to the constituent micro organisms and their products
