

Transmission Lines

- Electrical power is transferred from generating stations to consumers through overhead lines and cables.

Electrical Characteristics

(a) Overhead lines

A transmission line is characterized by four parameters: series resistance R due to the conductor resistivity, shunt conductance G due to leakage currents between the phases and ground, series inductance L due to magnetic field surrounding the conductors, and shunt capacitance C due to the electric field between conductors.

Series Resistance (R). The resistances of lines accounting for stranding and skin effect are determined from manufacturers' tables.

Shunt Conductance (G). The shunt conductance represents losses due to leakage currents along insulator strings and corona. In power lines, its effect is small and usually neglected.
