N. Keller,2007-08-02 In the last 50 years a wealth of information has allowed us to understand the contribution of various regulatory factors that alter mRNA and protein s thesis to a variety of physiological and pathological conditions However such regulation is only one of many factors that contribute to the levels of a given p tein One major factor that has been relatively obscure until recently has been the contribution of protein degradation to the regulation of the steady state level of protein expression and protein function This rapidly evolving field has made a significant mark on the scientific community as highlighted by the Award of the Nobel Prize in Chemistry for 2004 to Aaron Ciechanover Avram Hershko and Irwin Rose for their pioneering work on the ubiquitin proteasome system UPS of protein degradation which is the subject of this volume In recent years e dence has been accumulating that suggests a role for UPS function in both ph iological and pathological settings In particular studies have implicated a central role for the UPS in cell cycle regulation cancer and neurodegeneration Two points are however worth bearing in mind First ubiquitin s function appears to extend far beyond the UPS and protein degradation second there are other important systems of intracellular protein degradation most notably autophagic systems through the lysosomes and

Cumulated Index Medicus ,1989 *Protein Degradation in Health and Disease* Michele Reboud-Ravaux,2012-12-06

Protein degradation has been identified as a major mechanism for the regulation of cellular functions Not surprisingly its deregulation is implied in almost any pathological condition This book describes how aged proteins are eliminated during cell metabolism how cell proliferation is regulated by protein degradation and how its deregulation can contribute to the development of cancer how protein degradation is modified during normal and abnormal aging in particular with regard to Alzheimer's disease and other degenerative diseases of the brain and central nervous system Attempts aiming at correcting these pathologies by interfering with deviations of the normal pathway of protein degradation are also treated **MHC**

Molecules: Expression, Assembly and Function Robert G. Urban,Roman M. Chicz,2012-12-06 3 nan expression systems have been used to make MHC molecules containing a single peptide of interest To date fifteen single peptide class I structures incorporating three different HLA and two different H 2 allotypes isotypes and four additional class II structures two single peptide complexes and two superantigen complexes have been reported These advances have enabled us to study the atomic detail of antigen presentation and the general mechanisms behind peptide binding and begin to construct models of T cell recognition Another area of research which has exploded over the past five years has been the identification of MHC associated peptides There are several methods one can use to determine the sequence identity of MHC restricted peptides Historically the most successful technique albeit crude and encumbered with serious limitations has been the use of overlapping synthetic peptides and T cell clones Unfortunately this method absolutely requires i knowledge of the target antigen ii availability of T cell clones and iii a relatively short overall length for the target source protein such that a set of overlapping peptides can be affordably synthesized Briefly the entire sequence of the target protein is chemically synthesized using overlapping peptides which are then screened for biological activity using standard T cell presentation assays Despite its limitations this method was used to identify the first immunodominant epitopes reported in the literature and continues to be used successfully today **Proteolysis in Cell Functions** Väinö K. Hopsu-Havu,Mikko

Järvinen,Heidrun Kirschke,1997 The proteolytic enzymes have an essential function in all cells Their activities are regulated by the rate of synthesis activation of proenzymes and by the rate of synthesis of their inhibitors They are synthesized in

ribosomes like any other proteins and transported to various storage organelles or secreted from the cells and are activated in the pericellular space or in interstitium Various cells and tissues have their characteristic enzyme patterns which serve their specific functions Proteolytic enzymes take part and often have a regulatory role in numerous phases of cell function e g cell division migration apoptotic as well as necrotic cell death etc Diseases in which proteolysis has been subject of active research are e g cancer metastasis viral infections e g HIV and Alzheimer s disease They are also an essential part in any tissue remodelling wound healing throughout the kingdom of fauna and flora Advances in Immunology Frank J. Dixon,2002-06-10 Advances in Immunology presents current developments as well as comprehensive reviews in immunology Articles in this volume address topics such as protein degradation and the generation of MHC class I presented peptides proteolysis and antigen presentation by MHC Class II molecules cytokine memory of T helper lymphocytes Ig gene hypermutation generalization of single immunological experiences by idiotypically mediated clonal connections and aging of the immune system Edited and authored by the foremost scientists in the field each volume provides up to date information and directions for future research
