Plante,2012-12-06 Angiotensin converting enzyme inhibitors ACEI represent the first class of antihypertensive agents that was designed and developed on the basis of a well defined physiopathological axis of arterial hypertension a vascular disorder that is now becoming one of the major causes of morbidity mortality not only in developed societies but also in the highly populated developing countries 1 CAPTOPRIL the prototype of the PRIL family which now comprises more than 40 molecule species was quite hazardous and the clinical development almost failed when serious side effects were reported in an alarmist fashion in reputable scientific journals such as the New England Journal of Medicine and Lancet Squibb Sons came very close to withdrawing CAPTOPRIL from clinical investigation 2 However after re examination of the data obtained from different categories of patients and appropriate dose adjustments the clinical use of CAPTOPRIL turned out to be revolutionary The prototype as well as other members of the PRIL family became the starting point for numerous basic and clinical research programs focusing on the interactions of ACEI with the kinin endothelin and nitric oxide systems and the contribution of the receptors for AT I AT 2 bradykinin Bland B ETA and ET B to the pharmacological actions 2 of the respective peptides This research activity led to the development of new pharmacological agents such as the angiotensin receptor antagonists and more recently the neutral endopeptidase inhibitors In the near
