Medical Bacteriology MIC 379

Bacteria are unicellular organisms that are found in nearly every environment on Earth. They are prokaryotic, which means they lack a true nucleus and other membrane-bound organelles. Instead, their genetic material is located in the cytoplasm in a region called the nucleoid.

Bacteria can be classified into different groups based on their shape, size, and the way they obtain energy. The three main shapes of bacteria are cocci (spherical), bacilli (rod-shaped), and spirilla (spiral-shaped). Bacteria can also vary in size, ranging from 0.5 to 5 micrometers in diameter.

Bacteria obtain energy in different ways. Some are autotrophs, which means they can synthesize their own organic compounds from inorganic sources such as carbon dioxide or hydrogen gas. Others are heterotrophs, which means they must obtain their energy from organic sources. Heterotrophs can be further classified as either saprotrophs, which obtain energy from dead organic matter, or parasites, which obtain energy from living organisms.

In addition to shape, size, and energy source, bacteria can also be classified based on other characteristics such as their cell wall composition and their ability to perform various metabolic processes. Understanding the classification and characteristics of bacteria is essential for their identification, diagnosis of bacterial infections, and the development of effective treatments.

The shape of bacteria is determined by their cell wall structure and the cytoskeleton that provides support to the cell. Cocci are spherical-shaped bacteria that may occur singly, in pairs (diplococci), chains (streptococci), or clusters (staphylococci). Examples of cocci include *Streptococcus pneumoniae*, the causative agent of pneumonia, and *Staphylococcus aureus*, a common cause of skin infections.

Bacilli are rod-shaped bacteria that can occur singly or in chains, and they are often motile due to the presence of flagella. Examples of bacilli include *Escherichia coli*, which normally inhabit the human gut but can cause infections in other parts of the body, and *Mycobacterium tuberculosis*, which causes tuberculosis.

Spirilla are spiral-shaped bacteria that may be rigid or flexible and can move by rotating their flagella. Examples of spirilla include *Vibrio cholerae*, the causative agent of cholera, and *Borrelia burgdorferi*, which causes Lyme disease.
