Novel Vaccination Strategies:

Novel Vaccination Strategies Stefan H. E. Kaufmann, 2006-01-24 The protection mode of most available vaccines is based on antibody responses Since efficient immune responses to many pathogens rely on activating all arms of the immune system traditional vaccine development does not provide efficient protection against many diseases Novel vaccination strategies need to allow presentation of antigens that activate the full array of the immune response in the right composition and should prevent pathogen entry by mobilizing the mucosal immune response New technological advances optimize the immunogenicity of live and sub unit vaccines This book offers an interdisciplinary overview on research and future strategies for rational vaccine design based on recent developments in molecular biology and immunology It covers new aspects of the immunological interplay between prokaryotic and eukaryotic systems as well as achievements in the development of novel vaccine candidates Chapters on edible vaccines on vaccines against bioterror agents and on economical and safety aspects of novel vaccine development round off this title

Novel Strategies in the Design and Production of Vaccines Sara Cohen, Avigdor Shafferman, 2013-06-29 Vaccination is one of the most efficient and cost effective methods of promoting human health and has been in clinical use for at least 200 years Nevertheless infectious diseases continue to constitute a constant threat to the well being of humanity Common pathogens once believed to be under control acquire increased virulence and resistance to drugs while exotic microorganisms emerged from hidden reservoirs to cause yet incurable diseases in humans These changes together with epidemic outbreaks related to political and socio economic instabilities increase the needs for the development of new advanced vaccines In this volume devoted to the proceedings of the 39th OHOLO Conference we present some of the recent strategies for the design and production of novel vaccines The advent of recombinant DNA technology has stimulated the production of several subunit vaccines In spite of the obvious advantages to this approach the limited immunogenicity of many subunit candidates has hindered their development Strategies to enhance the immunogenicity of subunit vaccines is

therefore critical Several approaches toward this goal including design of novel adjuvants and delivery systems as well as design of advantageous carriers are presented here Among the carriers evaluated here are polypeptides flagellin HBV core antigen J3 galactosidase attenuated virions Vaccinia Sindbis and nonpathogenic licensed bacteria Salmonella

Vaccines for Biodefense and Emerging and Neglected Diseases Alan D.T. Barrett, Lawrence R. Stanberry, 2009-03-05 The last 20 years has seen a rapid increase in infectious diseases particularly those that are termed emerging diseases such as SARS neglected diseases such as malaria and those that are deemed biothreats such as anthrax It is well recognized that the most effective modality for preventing infectious diseases is vaccination This book provides researchers with a better understanding of what is currently known about these diseases including whether there is a vaccine available or under development It also informs readers of the key issues in development of a vaccine for each disease Provides a comprehensive treatise of the agents that are responsible for emerging and neglected diseases and those that can be used as biothreats Includes the processes such as the vaccine development pathway vaccine manufacturing and regulatory issues that are critical to the generation of these vaccines to the marketplace Each chapter will include a map of the world showing where that particular disease is naturally found

Reassessing Twenty Years of Vaccine Development Against Tuberculosis Ulrich E.

Schaible,Stefan H. Kaufmann,2018-03-23 Tuberculosis TB remains the prime bacterial infection worldwide with 10 4 million infections and a death toll of 1 7 million people in 2016 according to WHO statistics Tuberculosis is caused by members of the Mycobacterium tuberculosis complex facultative intracellular bacteria able to thrive within otherwise potent innate defense cells the macrophages In a world of increasing numbers of infections with drug resistant M tuberculosis strains the daunting race between developing new therapeutics and emerging resistant strains will hardly produce a winner This cycle can only be broken by enhancing population wide immune control through a better vaccine as the only one currently in use M bovis Bacillus Calmette Guerin BCG The protective efficacy of BCG against pulmonary tuberculosis in all age groups is dissatisfying and geographically highly diverse with the tropical areas showing the lowest efficacy rates Despite worldwide vaccination coverage the impact of BCG on the steep decrease of tuberculosis incidence rates in the developed world seems therefore questionable and can rather be attributed to improved social housing and nutritional conditions better health care surveillance and treatment systems The last 15 years saw tremendous efforts to improve vaccination strategies against tuberculosis Different paths of vaccine approaches were followed including genetically improved BCG strains attenuated M tuberculosis variants recombinant viral vectors and subunit vaccine candidates combined with novel more potent adjuvants With the first novel vaccine candidates being evaluated in clinical phases II and III and initial results chastening the expectations a critical reassessment of all candidates is inevitable Here we assembled experts to review and assess the current status of novel anti tuberculosis vaccine candidates their efficacy and prospects for implementation as well as the pitfalls and possible measures for improvement
