

The neutron strikes the nucleus and is absorbed.

The absorbed neutron causes the nucleus to undergo deformation.

In about 10^{-14} second, one of the deformations is so drastic that the nucleus cannot recover.

The nucleus fissions, releasing an average of two to three neutrons.

In about 10^{-12} second, the fission fragments lose their kinetic energy and come to rest, emitting a number of gamma rays. Now the fragments are called fission products.

The fission products lose their excess energy by radioactive decay, emitting particles over a lengthy time period (seconds to years).

ERDA Energy Research Abstracts, 1985 **Research and Development in Progress**, 1973 *The Nuclear Fission Process* Cyriel Wagemans, 1991-09-20 This text provides a comprehensive review of knowledge regarding nuclear fission from both the purely scientific and practical points of view Topics discussed include fission barriers spontaneous fission neutron induced fission cross sections photon and electron induced fission charged particle induced fission fragment angular momentum and ternary fission The characteristics of other reaction products are also discussed Contributed articles from several distinguished nuclear scientists guarantee adequate treatment of some of the specialized research fields included in the text Intended primarily as an introduction to nuclear fission for graduate students this book will also provide useful information for nuclear physicists involved with research or teaching *Advances in Nuclear Dynamics 2* Benito Arruñada, Gary D. Westfall, 1996-08-31 The 12th Winter Workshop on Nuclear Dynamics carried on the tradition started in 1978 of bringing together scientists working in all regimes of nuclear dynamics This broad range of related topics allows the researcher attending the Workshop to be exposed to work that normally would be considered outside his her field but could potentially add a new dimension to the understanding of his her work At Snowbird we brought together experimentalists working with heavy ion beams from 10 MeV nucleon up to 200 GeV nucleon and theoretical physicists working in diverse areas ranging from antisymmetrized fermionic dynamics to perturbative quantum chromodynamics Future work at RHIC was discussed also with presentations from several of the experimental groups In addition several talks addressed issues of cross disciplinary relevance from the study of water drop collisions to the multi fragmentation of buckyballs Clearly the field of nuclear dynamics has a bright future The understanding of the nuclear equation of state in all of its manifestations is being expanded on all fronts both theoretically and experimentally Future Workshops on Nuclear Dynamics will certainly have much progress to report Gary D Westfall Wolfgang Bauer Michigan State University **PREVIOUS WORKSHOPS** The following table contains a list of the dates and locations of the previous Winter Workshops on Nuclear Dynamics as well as
