Nuclear Fuel Performance:

Nuclear Fuel Elements Brian R. T. Frost, 2013-10-22 Nuclear Fuel Elements Design Fabrication and Performance is concerned with the design fabrication and performance of nuclear fuel elements with emphasis on fast reactor fuel elements Topics range from fuel types and the irradiation behavior of fuels to cladding and duct materials fuel element design and modeling fuel element performance testing and qualification and the performance of water reactor fuels Fast reactor fuel elements research and test reactor fuel elements and unconventional fuel elements are also covered This volume consists of 12 chapters and begins with an overview of nuclear reactors and fuel elements as well as fuel element design and development based on the reactor operator s approach materials scientist s approach and interdisciplinary approach The reader is then introduced to different types of nuclear fuels and their irradiation behavior considerations for using cladding and duct materials in fuel element design and development and fuel element design and modeling The chapters that follow focus on the testing of fuel element performance experimental techniques and equipment for testing fuel element designs and the performance of fuels for water reactors Fuel elements for gas cooled reactors fast reactors and research and test reactors are also described The book concludes with an assessment of unconventional fuel elements This book will be useful to fuel element technologists as well as materials scientists and engineers Nuclear Fuel Performance British Nuclear Energy Society, 1973 *Nuclear Fuel Performance Evaluation* Electric Power Research Inst., Palo Alto, CA (USA), 1977

parallel finite element based code BISON and the NRC auditing code FRAPCON Multiple areas of research remain to be addressed in fuel performance while physics based approaches often reach their limits Studies to be presented in this thesis therefore revolve around applying data driven methods to address these issues First discrepancies always exist between code predictions and real world responses thus uncertainties must be quantified for the code predictions for benefit of decision making operation safety and design optimization Systematic validation and verification are performed for BISON first followed by a holistic sensitivity analysis SA framework built upon a complete set of uncertain input parameters The number of uncertain input parameters can be effectively reduced based on the obtained qualitative importance ranking benefiting the subsequent uncertainty quantification UQ To enhance the predictability a novel Bayesian inference framework is introduced to efficiently calibrate the expensive high fidelity tools possibly without resorting to approximate surrogate methods The calibrated prediction aligns better with experimental observations and is subject to significantly reduced uncertainty Second while full core monitoring of fuel behaviors can provide the most realistic assessment of safety margins its computational cost for use in design and operation optimization is prohibitive Machine learning ML methods were used to construct fast running full core surrogates which achieves a runtime acceleration of more than 10 000 1 000 times compared to FRAPCON for the standard high burnup PWR cores allowing for direct coupling of full core fuel response into core design optimization in the future Then for purpose of full core PCI monitoring which requires BISON as the high fidelity simulation tool a physics informed multi fidelity ML framework is introduced to significantly reduce the number of necessary code runs Finally deep learning models are trained to predict the spatiotemporal distribution of the cladding hoop stress The proposed data driven methods for the selected applications enlightens the nuclear community on practical pathways to realize meaningful improvements in fuel performance assessment

Modelling of Nuclear Fuel Behaviour, 2011 *Nuclear Fuel Performance* British Nuclear Energy Society, 1973 Nuclear Fuel Performance British Nuclear Energy Society, 1974 A Validation Study of the AMP Nuclear Fuel Performance Code Aaron Martin Phillippe, 2012 The Advanced Multi Physics AMP Fuel Performance Code is a fully coupled 3 dimensional 3D code currently in development at the Oak Ridge National Laboratory ORNL for the purposes of advanced fuel performance evaluation and simulation The purpose of this study was to investigate and examine the capabilities of AMP as developed so far in thermo mechanical evaluations of experimental benchmark data The IFA 432 and IFA 597 datasets from the Nuclear Energy Agency's NEA International Fuel Performance Experiments IFPE database were examined and a code to code comparison made against FRAPCON 3.4 a one dimensional 1D code used by the Nuclear Regulatory Commission NRC for fuel licensing AMP was found to predict centerline temperatures consistent with the experimental measurements and the FRAPCON code in range and behavior for the initial irradiation steps of the datasets This was in spite of lacking implementation of all the physics inherent to nuclear fuel The results of this study show that AMP has the promise of more accurate and robust fuel evaluations as the development of the code progresses **Nuclear Fuel**

Performance, 1973 British Nuclear Energy Society, 1973 Roadmap to an Engineering-Scale Nuclear Fuel Performance & Safety Code, 2009

Developing new fuels and qualifying them for large scale deployment in power reactors is a lengthy and expensive process typically spanning a period of two decades from concept to licensing Nuclear fuel designers serve an indispensable role in the process at the initial exploratory phase as well as in analysis of the testing results In recent years fuel performance capabilities based on first principles have been playing more of a role in what has traditionally been an empirically dominated process Nonetheless nuclear fuel behavior is based on the interaction of multiple complex phenomena and recent evolutionary approaches are being applied more on a phenomenon by phenomenon basis targeting localized problems as opposed to a systematic approach based on a fundamental understanding of all interacting parameters Advanced nuclear fuels are generally more complex and less understood than the traditional fuels used in existing reactors ceramic UO₂ with burnable poisons and other minor additives The added challenges are primarily caused by a less complete empirical database and in the case of recycled fuel the inherent variability in fuel compositions It is clear that using the traditional approach to develop and qualify fuels over the entire range of variables pertinent to the U S Department of Energy DOE Office of Nuclear Energy on a timely basis with available funds would be very challenging if not impossible As a result the DOE Office of Nuclear Energy has launched the Nuclear Energy Advanced Modeling and Simulation NEAMS approach to revolutionize fuel development This new approach is predicated upon transferring the recent advances in computational sciences and computer technologies into the fuel development program The effort will couple computational science with recent advances in the fundamental understanding of physical phenomena through ab initio modeling and targeted phenomenological testing to leapfrog many fuel development activities Realizing the full benefits of this approach will likely take some time However it is important that the developmental activities for modeling and simulation be tightly coupled with the experimental activities to maximize feedback effects and accelerate both the experimental and analytical elements of the program toward a common objective The close integration of modeling and simulation and experimental activities is key to developing a useful fuel performance simulation capability providing a validated design and analysis tool and understanding the uncertainties within the models and design process The efforts of this project are integrally connected to the Transmutation Fuels Campaign TFC which maintains as a primary objective to formulate fabricate and qualify a transuranic based fuel with added minor actinides for use in future fast reactors Additional details of the TFC scope can be found in the Transmutation Fuels Campaign Execution Plan This project is an integral component of the TFC modeling and simulation effort and this multiyear plan borrowed liberally from the Transmutation Fuels Campaign Modeling and Simulation Roadmap This document provides the multiyear staged development plan to develop a continuum level Integrated Performance and Safety Code IPSC to predict the behavior of the fuel and cladding during normal reactor operations and anticipated transients up to the point of clad breach An Introduction to Current Modeling Techniques in Nuclear Fuel

According to the future of the nuclear fuel cycle study at MIT a reactor with a conversion ratio around one can achieve desired objectives in the long term sustainability of uranium and reduction of transuranic wastes This finding relaxes the need for sodium fast reactors SFR in a closed loop nuclear fuel cycle and enables high conversion light water reactors HC LWR to be used as an alternative HC LWRs have two major advantages over SFRs First apart from the reactor core the remaining reactor system can be based on existing LWR technology Second extensive operating experience and a proven record of high reliability of LWRs would ease licensing and commercialization processes Therefore operating HC LWRs instead of SFRs may be more economically and technically viable with lower capital and development cost for the near term This type of reactor is being developed by Hitachi Ltd under the name of resource renewable boiling water reactor RBWR This study focuses on RBWR TB2 transuranic burning version of RBWR To demonstrate that the RBWR TB2 can operate safely within design constraints and regulatory limits the thermomechanical behavior of this reactor has been analyzed through fuel performance modeling Due to its unique design characteristics several physical phenomena at high temperature and high burnup typically ignored in most LWR fuel performance codes can potentially become active under RBWR s operating conditions These phenomena involve migration of fuel constituents and fission products the evolution of O M ratio with burnup high burnup structure HBS formation accelerated corrosion hot pressing gaseous fuel swelling hydride precipitation and hydrogen migration in the cladding Semi empirical models describing porosity and cesium migration behaviors have been replaced with mechanistic models All of these phenomena have been successfully implemented in a modified version of FRAPCON 3.5 known as FRAPCON 3.5 EP where EP stands for enhanced performance The fuel performance comparison between RBWR TB2 and ABWR fuel rods suggest that because of high axial peaking factors and relatively flat power history fuel temperature is significantly higher in fissile zones of the RBWR TB2 leading to various undesirable effects such as excessive fission gas release and cladding deformation Local fuel burnup in fissile zones of RBWR TB2 is multiple times higher than that of ABWR leading to excessive fuel swelling accelerated cladding oxidation and PCMI at fissile blanket interfaces Even if the RBWR TB2 has to operate under such demanding conditions with a small margin to fuel melting a steady state fuel performance analysis still shows that this reactor can operate safely with an acceptable thermo mechanical performance In the future optimization of RBWR TB2 performance several fuel design strategies are recommended based on a series of sensitivity studies The sensitivity study on key design parameters indicates that using annular fuel geometry and more hypostoichiometric fuel lower O M ratio could reduce fuel temperature at high burnup For better resistance to cladding corrosion and PCMI it is recommended to increase cladding thickness and decrease fuel density
