Nucleation And Crystallization In Liquids And Glasses Ceramic Transactions Volume 3:

Crystallization and Materials Science of Modern Artificial and Natural Crystals Elena Borisenko, 2012-01-20

Crystal growth is an important process which forms the basis for a wide variety of natural phenomena and engineering developments. This book provides a unique opportunity for a reader to gain knowledge about various aspects of crystal growth from advanced inorganic materials to inorganic organic composites. It unravels some problems of molecular crystallizations and shows advances in growth of pharmaceutical crystals. It tells about biomineralization of mollusks and cryoprotection of living cells. It gives a chance to learn about statistics of chiral asymmetry in crystal structure.

Glass Ceramic Technology Wolfram Höland, George H. Beall, 2012-07-03. Glass ceramic materials share many properties with both glass and more traditional crystalline ceramics. This new edition examines the various types of glass ceramic materials, the methods of their development and their countless applications. With expanded sections on biomaterials and highly bioactive products, i.e. Bioglass and related glass ceramics as well as the newest mechanisms for the development of dental ceramics and theories on the development of nano scaled glass ceramics, here is a must have guide for ceramic and materials engineers, managers and designers in the ceramic and glass industry.

Nucleation Dima Kashchiev, 2000-02-22. This book represents a detailed and systematic account of the basic principles, developments and applications of the theory of nucleation. The formation of new phases begins with the process of nucleation and is therefore a widely spread phenomenon in both nature and technology. Condensation and evaporation, crystal growth, electrodeposition, melt crystallization, growth of thin films for microelectronics, volcano eruption and formation of particulate matter in space are only a few of the processes in which nucleation plays a prominent role. The book has four parts which are devoted to the thermodynamics of nucleation, the kinetics of nucleation, the effect of various factors on nucleation and the application of the theory to other processes which involve nucleation. The first two parts describe in detail the two basic approaches in nucleation theory: the thermodynamic and the kinetic ones. They contain derivations of the basic and most important formulae of the theory and discuss their limitations and possibilities for improvement. The third part deals with some of the factors that can affect nucleation and is a natural continuation of the first two chapters. The last part is devoted to the application of the theory to processes of practical importance such as melt crystallization and polymorphic transformation, crystal growth and growth of thin solid films, size distribution of droplets and crystallites in condensation and crystallization. The book is not just an account of the status quo in nucleation theory; throughout the book there are a number of new results as well as extensions and generalisations of existing ones.
