Robot Components and Systems François Lhôte, Pierre André, Jean-Pierre Taillard, Jean-Marie Kauffmann, 2013-03-09 The contemporary industrial robot is the focal point of a wide variety of elements in modern technology It is a collection of parts some of which act as drives and some of which act as architectural materials that give the robot body strength This book is a thorough inventory of the technologies involved and the way in which they meet and work together in order to produce a functional robot arm The authors have striven to describe thoroughly the components that make up robot arms This gives both the student and the practitioner a complete view of the principles involved in such components and the differences between existing technologies However it is not only the student who benefits from this approach but also the potential robot user who at the moment may be faced with a bewildering choice of combinations of different types of components in the robots that are available to him For example it is difficult for a production manager to appreciate the differences between robots that use direct current motors stepping motors and pneumatic actuators The authors have succeeded in structuring the book so that the reader can weigh up the pros and cons of these different techniques at whatever level of depth he requires Certainly the book aims to provide as much depth as there is in these topics without assuming a detailed knowledge of specialized areas of engineering
