

WASTE WATER TREATMENT PROCESS

An overview of how waste water is cleaned and treated before returning to the water supply.

(Methods vary between countries depending on water standards)

30% of the World's population does not have adequate sanitation

Source: World Health Organisation

1

Waste water and sewage is pumped underground to the lifting station where it is chemically treated and sent for separation

2

The separation process filters out solids larger than 12mm. This waste is then transported to a refuse facility and buried

3

Primary settling basins allow heavier material to sink and be stripped away. The waste is then fermented for 30 days and used as fertilizer

4

Effluent is then pumped to the two reactors for 8 hours. Through a series of stages bacteria break down harmful matter and clean the water

5

Secondary Clarifiers gravity feed the water through and bacteria continues to clean the water to a drinkable level

6

The water is finally chemically treated with chlorine to ensure it is free from bacteria. Then it passes over a weir and into the water supply

waste containing some solids produced by humans It typically consists of washing water faeces urine laundry waste and other material which goes down drains and toilets from households and industry Sewage sludge is an end product of the wastewater treatment process This material can be a wonderful source of nutrients for the soil This book provides current studies and research on the treatment and use of sewage Using this material as a fertiliser can benefit the environment by turning wastes into valuable resources These sludges would otherwise have to be disposed of by landfilling lagooning incineration or ocean dumping On the other hand heavy metals sometimes found in sewage sludge may present environmental problems as there is filtration of metals towards the aquifers which get contaminated This book addresses these concerns as well as benefits *Health Implications of Sewage Treatment Facilities* Southwest Research Institute,1978
