Steponkus, 1996-12-17 **Advances in Low Temperature Biology** **Cell-Penetrating Peptides** Ulo Langel, 2002-05-29 One of the major problems with drug delivery is the inability of large hydrophilic compounds to pass through the lipid membrane of the cell thus making drugs such as polypeptides and oligonucleotides of limited therapeutic value Until recently the transport of such molecules into the cytoplasmic and nuclear compartments of living cells seemed a

Edible Nanostructures Alejandro G Marangoni, David Pink, 2015-10-20 Food Scientists have been teaching the subject in the same way for the past fifty years This book therefore aims to modernise the coverage of the subject bringing it in line with the recent and extensive developments in Materials Science in particular the field of supramolecular chemistry of food components has been generally

overlooked in textbooks Edible Nanostructures will summarise developments in the areas of protein aggregation and gelation starch crystallography emulsions and fat crystal network nanostructure and microstructure addressing their functionalities in food Each chapter offers both the qualitative view and a basic quantitative treatment of the area including basic models used to describe structure and its relationship to functionality if they exist This is the first book on nanostructures in foods and is suitable as a textbook for undergraduate students in Chemistry Physics and Food Science *Low Temperature and Cryogenic Refrigeration* Sadik Kakaç,M.R. Avelino,H.F. Smirnov,2012-12-06 Refrigeration plays a prominent role in our everyday lives and cryogenics plays a major role in medical science space technology and the cooling of low temperature electronics This volume contains chapters on basic refrigeration systems non compression refrigeration and cooling and topics related to global environmental issues alternative refrigerants optimum refrigerant selection cost quality optimization of refrigerants advanced thermodynamics of reverse cycle machines applications in medicine cryogenics heat pipes gas solid absorption refrigeration multisalt resorption heat pumps cryocoolers thermoacoustic refrigeration cryogenic heat transfer and enhancement and other topics covering theory design and applications such as pulse tube refrigeration which is the most efficient of all cryocoolers and can be used in space missions *Handbook of Sample Preparation for Scanning Electron Microscopy and X-Ray Microanalysis* Patrick Echlin,2011-04-14 Scanning electron microscopy SEM and x ray microanalysis can produce magnified images and in situ chemical information from virtually any type of specimen The two instruments generally operate in a high vacuum and a very dry environment in order to produce the high energy beam of electrons needed for imaging and analysis With a few notable exceptions most specimens destined for study in the SEM are poor conductors and composed of beam sensitive light elements containing variable amounts of water In the SEM the imaging system depends on the specimen being sufficiently electrically conductive to ensure that the bulk of the incoming electrons go to ground The formation of the image depends on collecting the different signals that are scattered as a consequence of the high energy beam interacting with the sample Backscattered electrons and secondary electrons are generated within the primary beam sample interactive volume and are the two principal signals used to form images The backscattered electron coefficient increases with increasing atomic number of the specimen whereas the secondary electron coefficient is relatively insensitive to atomic number This fundamental difference in the two signals can have an important effect on the way samples may need to be prepared The analytical system depends on collecting the x ray photons that are generated within the sample as a consequence of interaction with the same high energy beam of primary electrons used to produce images
