Mapping And Spatial Modelling For Navigation:

Mapping and Spatial Modelling for Navigation Louis F. Pau, 2012-12-06 The successful implementation of applications in spatial reasoning requires paying attention to the representation of spatial data. In particular, an integrated and uniform treatment of different spatial features is necessary in order to enable the reasoning to proceed quickly. Currently, the most prevalent features are points, rectangles, lines, regions, surfaces, and volumes. As an example of a reasoning task, consider a query of the form: find all cities with population in excess of 5,000 in wheat growing regions within 10 miles of the Mississippi River. Note that this query is quite complex. It requires processing a line map for the river, creating a corridor or buffer to find the area within 10 miles of the river, a region map for the wheat, and a point map for the cities. Spatial reasoning is eased by spatially sorting the data, i.e., a spatial index. In this paper, we show how hierarchical data structures can be used to facilitate this process. They are based on the principle of recursive decomposition, similar to divide and conquer methods. In essence, they are used primarily as devices to sort data of more than one dimension and different spatial types. The term quadtree is often used to describe this class of data structures. In this paper, we focus on recent developments in the use of quadtree methods. We concentrate primarily on region data. For a more extensive treatment of this subject, see SameS4a, SameSSa, SameSSb, SameSSc, SameSga, SameSgbj. **Mapping and Spatial Modelling for Navigation** L. F. Pau, 1989

The Construction of Cognitive Maps Juval Portugali, 2007-08-23 and processes which are exclusive to humans in their encoding, storing, decoding, and retrieving spatial knowledge for various tasks. The authors present and discuss connectionist models of cognitive maps which are based on local representation versus models which are based on distributed representation, as well as connectionist models concerning language and spatial relations. As is well known, Gibson's 1979 ecological approach suggests a view on cognition which is diametrically different from the classical main stream view: perception and thus cognition is direct, immediate, and needs no internal information processing and is thus essentially an external process of interaction between an organism and its external environment. The chapter by Harry Heft introduces J. J. Gibson's ecological approach and its implication to the construction of cognitive maps in general and to the issue of wayfinding in particular. According to Heft, main stream cognitive sciences are essentially Cartesian in nature and have not as yet internalized the implications of Darwin's theory of evolution. Gibson, in his ecological approach, has tried to do exactly this. The author introduces the basic terminology of the ecological approach and relates its various notions, in particular, optic flow, nested hierarchy, and affordances to navigation, and the way routes and places in the environment are learned.
