Edward Bittar, J. Kevin Chipman, 1997 Cellular toxicology has entered a new era No longer are we concerned only with necrotic cell death produced by severe acute insult often to multiple intracellular targets leading to disruption of the cell membrane New advances in molecular and cellular biology are allowing the dissection of mechanisms of cell death involving more subtle targets within the cell Toxicology has been very important not only in understanding the mechanisms nature and severity of toxicity and thereby helping in risk assessment but toxicology has also played a very important role in helping to understand basic biological processes Historically this has perhaps been most evident in the use of toxic agents to interfere with specific reactions in the body and hence help to dissect out the mechanisms of metabolic processes For example the use of chemical inhibitors was very important in understanding the process of oxidative phosphorylation or the tricarboxylic acid cycle More recent examples are seen herein where toxicology interfaces with for example structural biology in the study of

the cytoskeletal components and their interactions Indirectly an understanding of the mechanisms of endogenous protective systems also improves knowledge of basic cell biology Toxic insult and manipulation of cell signalling and control mechanisms in cell growth and differentiation also highlight how important the discipline of cell toxicity has been and will continue to be a major contributor to our understanding of basic issues in the biological and biomedical sciences This book offers selected reviews of some of the principal molecular mechanisms of cell toxicity
