Mechanisms Of Secondary Brain Damage:

Mechanisms of Secondary Brain Damage A. Baethmann, K. G. Go, A. Unterberg, 2013-03-09 A distinction between primary and secondary brain damage of various origin particularly in acute lesions such as head injury and ischemia is not entirely new. The concept is of practical significance because it is the foremost intention of all clinical efforts to prevent or at least attenuate the development of secondary sequelae. Primary damage to nervous elements usually cannot be influenced by treatment. Its prevention is the objective of prophylactic measures. The current volume gathered prominent scientists and clinicians from various fields to provide a competent introduction and survey of the various aspects involved in secondary brain damage. It was attempted to provide criteria for the distinction between the primary and secondary phenomena on a morphological and functional level on the basis of the kinetics involved and most importantly regarding the different specific manifestations such as disturbances of microcirculation, aspects of the blood brain barrier and of cellular structure and function at a molecular level. Although it was not expected that a grand unifying hypothesis will be reached reconcilable with the many occasionally opposing views on such a complex subject nevertheless the present volume attains an appropriate result. It can best be described as a mosaic of many different pieces which only as an ensemble reflect the current state of the art.

Mechanisms of Secondary Brain Damage from Trauma and Ischemia A. Baethmann, J. Eriskat, J. Lehmberg, N. Plesnila, 2012-12-06 Top level clinical and laboratory scientists present their most recent clinical and experimental findings and concepts. The well balanced contributions illustrate the enormous significance of the dialogue between both laboratory and clinic ultimately for the benefit of the patients and contribute to a better understanding of secondary brain damage from trauma and ischemia as basis to develop more effective treatment including drugs.

Mechanisms of Secondary Brain Damage in Cerebral Ischemia and Trauma Alexander Baethmann, Oliver S. Kempfski, Nikolaus Plesnila, Frank Staub, 2012-12-06 The publication of the Vth International Symposium 1995 on Mechanisms of Secondary Brain Damage in Maastricht, Italy is a collection of focused reviews reaching from novel molecular and cell biological findings to aspects of clinical management in head injury and cerebral ischemia. A specific purpose of these series of meetings introduced in 1984 is for an exchange on problems of mutual interest by international high ranking experts from the basic sciences and related clinical disciplines such as intensive care medicine, neurology or neurosurgery. The present volume covers three major areas: a) Molecular and cell biological mechanisms including inflammation; b) Novel findings on mechanisms and treatment in cerebral ischemia; c) Secondary processes in head injury, regeneration and treatment. Molecular and cell biology is currently attracting attention towards activation of genomic processes associated with the demise of cells referred to as programmed cell death and apoptosis which actually might be distinguished from each other. Thus the phenomenon of delayed neuronal death in selectively vulnerable brain areas following brief interruption of blood flow is scrutinized as to the contribution of the activation of suicide genes. The physiological role of such a response among others is removal of surplus neurons during

ontogenesis of the brain Yet evidence is accumulating that similar mechanisms play a role in cerebral ischemia probably also trauma where nerve and other cells demonstrate features of apoptosis Observations on protection of neurons by administration of protein synthesis inhibitors in cerebral ischemia provide more direct support

Mechanisms of Secondary Brain Damage Alexander Baethmann, Oliver Kempfs, Ludwig Schürer, 2012-12-06 Great progress has been made in the understanding and prevention of secondary brain damage from acute cerebral disorders such as trauma and ischemia Advances may be concerned in particular with better organization and logistics of preclinical emergency care including rapid arrival of well trained medical staff on the scene of an accident and of transportation to a competent hospital Nevertheless it is a safe assumption that development of secondary brain damage from both intra and extracranial causes still represents a major factor for the final outcome in severe head injury Thus exchanges of experiences and information between various disciplines involved with this important clinical problem trauma still assumes the number one position as a cause of morbidity and mortality up to an age of 45 years may provide a basis for in depth analysis of remaining problems as well as of methods of their solution This exactly is the purpose of the present publication on concepts and findings pertinent for the general subject of secondary brain damage from various experimental as well as clinical viewpoints An internationally high ranking group of experts has been contributing to this collection of reviews on cerebral trauma and ischemia and its adverse sequelae including cerebral exploration by most modern technologies such as NMR spectroscopy or PET scanning among others

Current Progress in the Understanding of Secondary Brain Damage from Trauma and Ischemia A. Baethmann, N. Plesnila, F. Ringel, J. Eriskat, 2012-12-06 Information is provided from the basic and clinical sciences on the mechanisms damaging the brain from trauma or ischemia New aspects involve the endoplasmic reticulum mitochondrial failure pathobiology of axonal injury molecular signals activating glial elements or the emerging therapeutic role of neurotrophins Experimental issues involve a better analysis of the ischemic penumbra the salvagable tissue Therapeutic contributions reach from the environmental influence to gene expression including neuroprotection such as hibernation mother nature's experiment or hypothermia which is reported to induce cell swelling Treatment issues deal also with thrombolysis and combination therapies or with the clearance of adverse blood components LDL fibrinogen by a novel procedure using heparin Other highlights are discussing the specificities of pediatric vs adult brain trauma or the evolving role of the Apolipoprotein E e4 gene in severe head injury An update is also provided on an online assessment of the patient management during the pre and early hospital phase in Southern Bavaria The empirical observation of neuroworsening is analyzed in further details whether this is a specificity autonomously driving the posttraumatic course Finally the unsolved question why drug trials in severe head injury have failed so far in view of the promising evidence from the laboratory is subjected to an expert analysis
