Natural Sinks Of CO₂:

Natural Sinks of CO₂ Joe Wisniewski, Ariel E. Lugo, 2012-12-06 Most of the attention with respect to the increase in atmospheric greenhouse gas concentrations centers around three issues human generated sources of carbon mostly from burning fossil fuels tropical deforestation which accelerates the production of atmospheric carbon while causing havoc with biodiversity and the economic development of tropical countries and the temperature increase that may accompany increased atmospheric greenhouse gas concentrations This is the first book to focus extensively on the reverse to emissions of carbon dioxide CO₂ i.e the sequestering of atmospheric carbon by aquatic and terrestrial ecosystems Natural ecosystems are currently sequestering carbon and it is economically feasible to manage existing and additional terrestrial forest soil saline land and aquatic coastal wetland and ocean ecosystems to substantially increase the level of carbon storage The prospect of managing natural systems to absorb additional carbon should begin to change the mindset under which scientists policy makers and society deal with the issue of further greenhouse gas increases Greenhouse Gas Sinks Dave Reay, 2007 In this first comprehensive handbook of the earth's sinks for greenhouse gases leading researchers from around the world provide an expert synthesis of current understanding and uncertainties It will be a valuable resource for students researchers and practitioners in conservation ecology and environmental studies **The Management of Natural Coastal Carbon Sinks** Dan Laffoley, Gabriel D. Grimsditch, 2009 **Greenhouse Gases: Sources, Sinks and Mitigation** Saurabh Sonwani, Pallavi Saxena, 2022-01-21 This book begins with a brief background on greenhouse gases sources and sinks and continues with a discussion in different sectors including forest fluxes to human health and modeling techniques to policy measures The chapters explore in detail about the GHG emission budgets mitigation strategies technical advancement and input output analysis Greenhouse gases GHGs occur naturally in our atmosphere and are essential to the survival of most of the organisms on the planet earth GHGs such as carbon dioxide methane nitrous oxide and ozone etc play a major role in balancing the radiative budget by absorbing or emitting some of the infrared rays reflecting from the earth's surface But unfortunately anthropogenic activities like use of fossil fuel intensive agriculture and livestock farming use of synthetic fertilizers deforestation and industrial processes etc have drastically interfered in the natural air composition by releasing excess greenhouse gases into the atmosphere This has led to the increase in the ability of the atmosphere to absorb more infrared energy This book is a complete information set covering all aspects of GHGs sources sinks and control mitigation strategies This book is also written in simple language with helpful photographs diagrams and flowcharts which will make the reader comfortable in understanding the concepts a more relatively easier way The book is a valuable tool for students in Environmental Science Ecology Biological Science Economics and Agriculture It is unique to environmental consultants researchers and other professionals involved in climate change studies Non governmental organizations NGO's *Climate Change 2021 - The Physical Science Basis* Intergovernmental Panel on Climate Change (IPCC), 2023-07-26 The Working

Group I contribution to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change IPCC provides a comprehensive assessment of the physical science basis of climate change. It considers in situ and remote observations, paleoclimate information, understanding of climate drivers and physical, chemical and biological processes and feedbacks, global and regional climate modelling, advances in methods of analyses and insights from climate services. It assesses the current state of the climate, human influence on climate in all regions, future climate change including sea level rise, global warming effects including extremes, climate information for risk assessment and regional adaptation, limiting climate change by reaching net zero carbon dioxide emissions and reducing other greenhouse gas emissions and benefits for air quality. The report serves policymakers, decision makers, stakeholders and all interested parties with the latest policy relevant information on climate change. Available as Open Access on Cambridge Core.

Environmental Chemistry, Structure and Organic Matter Storage in Agricultural Soils M.R. Carter, Bobby A. Stewart, 1995-10-23

Soils comprise the largest pool of terrestrial carbon and therefore are an important component of carbon storage in the biosphere-atmosphere system. *Structure and Organic Matter Storage in Agricultural Soils* explores the mechanisms and processes involved in the storage and sequestration of carbon in soils. Focusing on agricultural soils from tropical to semi-arid types, this new book provides an in-depth look at structure, aggregation and organic matter retention in world soils. The first two sections of the book introduce readers to the basic issues and scientific concepts including soil structure, underlying mechanisms and processes and the importance of agroecosystems as carbon regulators. The third section provides detailed discussions of soil aggregation and organic matter storage under various climates, soil types and soil management practices. The fourth section addresses current strategies for enhancing organic matter storage in soil, modelling techniques and measurement methods. Throughout the book, the importance of the soil structure-organic matter storage relationship is emphasized. Anyone involved in soil science, agriculture, agronomy, plant science or greenhouse gas and global change studies should understand this relationship. *Structure and Organic Matter Storage in Agricultural Soils* provides an ideal source of information not only on the soil structure-storage relationship itself but also on key research efforts and direct applications related to the storage of organic matter in agricultural soils.

The Natural Environment and the Biogeochemical Cycles, 2013-11-11

Environmental Chemistry is a relatively young science. There is a lot of interest in this subject, however, it is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline, there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject. One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment. A major purpose of this series on Environmental Chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment. The industrial activities of man have given a new

dimension to Environmental Chemistry We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually We ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas Much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems

Understanding Earth's Deep Past National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on the Importance of Deep-Time Geologic Records for Understanding Climate Change Impacts, 2011-08-02 There is little dispute within the scientific community that humans are changing Earth's climate on a decadal to century time scale By the end of this century without a reduction in emissions atmospheric CO₂ is projected to increase to levels that Earth has not experienced for more than 30 million years As greenhouse gas emissions propel Earth toward a warmer climate state an improved understanding of climate dynamics in warm environments is needed to inform public policy decisions In Understanding Earth's Deep Past the National Research Council reports that rocks and sediments that are millions of years old hold clues to how the Earth's future climate would respond in an environment with high levels of atmospheric greenhouse gases Understanding Earth's Deep Past provides an assessment of both the demonstrated and underdeveloped potential of the deep time geologic record to inform us about the dynamics of the global climate system The report describes past climate changes and discusses potential impacts of high levels of atmospheric greenhouse gases on regional climates water resources marine and terrestrial ecosystems and the cycling of life sustaining elements While revealing gaps in scientific knowledge of past climate states the report highlights a range of high priority research issues with potential for major advances in the scientific understanding of climate processes This proposed integrated deep time climate research program would study how climate responded over Earth's different climate states examine how climate responds to increased atmospheric carbon dioxide and other greenhouse gases and clarify the processes that lead to anomalously warm polar and tropical regions and the impact on marine and terrestrial life In addition to outlining a research agenda Understanding Earth's Deep Past proposes an implementation strategy that will be an invaluable resource to decision makers in the field as well as the research community advocacy organizations government agencies and college professors and students Britannica Guide to Climate Change Encyclopaedia Britannica, Inc., 2008-10-01 There are a few subjects that divide opinion more than climate change What is the truth Can the solution be found in a global political treaty or individual action This Britannica guide gives a clear overview of the scientific evidence from data showing how the atmosphere has changed in the last 4.5 billion years to more recent studies on the symptoms of a warming planet and the

Earth, Our Living Planet Philippe Bertrand, Louis Legendre, 2021-04-21 Earth is to our knowledge the only life bearing body in the Solar System This extraordinary characteristic dates back almost 4 billion years How to explain that Earth is teeming with organisms and that this has lasted for so long What makes Earth different from its sister planets Mars and Venus The habitability of a planet is its capacity to allow the emergence of organisms What astronomical and geological conditions concurred to make Earth habitable 4 billion years ago and how has it remained habitable since What have been the respective roles of non biological and biological characteristics in maintaining the habitability of Earth This unique book answers the above questions by considering the roles of organisms and ecosystems in the Earth System which is made of the non living and living components of the planet Organisms have progressively occupied all the habitats of the planet diversifying into countless life forms and developing enormous biomasses over the past 3.6 billion years In this way organisms and ecosystems took over the Earth System and thus became major agents in its regulation and global evolution There was co evolution of the different components of the Earth System leading to a number of feedback mechanisms that regulated long term Earth conditions For millennia and especially since the Industrial Revolution nearly 300 years ago humans have gradually transformed the Earth System Technological developments combined with the large increase in human population have led in recent decades to major changes in the Earth's climate soils biodiversity and quality of air and water After some successes in the 20th century at preventing internationally environmental disasters human societies are now facing major challenges arising from climate change Some of these challenges are short term and others concern the thousand year evolution of the Earth's climate Humans should become the stewards of Earth
