Nonautonomous Dynamical Systems in the Life Sciences Peter E. Kloeden, Christian Pötzsche, 2014-01-22 Nonautonomous dynamics describes the qualitative behavior of evolutionary differential and difference equations whose right hand side is explicitly time dependent Over recent years the theory of such systems has developed into a highly active field related to yet recognizably distinct from that of classical autonomous dynamical systems This development was motivated by problems of applied mathematics in particular in the life sciences where genuinely nonautonomous systems abound The purpose of this monograph is to indicate through selected representative examples how often nonautonomous systems occur in the life sciences and to outline the new concepts and tools from the theory of nonautonomous dynamical systems that are now available for their investigation

Gradings on Simple Lie Algebras

Alberto Elduque, Mikhail Kochetov, 2013 Gradings are ubiquitous in the theory of Lie algebras from the root space decomposition of a complex semisimple Lie algebra relative to a Cartan subalgebra to the beautiful Dempwolff decomposition of E_8 as a direct sum of thirty one Cartan subalgebras This monograph is a self contained exposition of the classification of gradings by arbitrary groups on classical simple Lie algebras over algebraically closed fields of characteristic not equal to 2 as well as on some nonclassical simple Lie algebras in positive characteristic Other important algebras also enter the stage matrix algebras the octonions and the Albert algebra Most of the presented results are recent and have not yet appeared in book form This work can be used as a textbook for graduate students or as a reference for researchers in Lie theory and neighbouring areas This book is published in cooperation with Atlantic Association for Research in the Mathematical Sciences AARMS

Topics in Hyperplane Arrangements Marcelo Aguiar, Swapneel Mahajan, 2017-11-22 This monograph studies the interplay between various algebraic geometric and combinatorial aspects of real hyperplane arrangements It provides a careful organized and unified treatment of several recent developments in the field and brings forth many new ideas and results It has two parts

each divided into eight chapters and five appendices with background material Part I gives a detailed discussion on faces flats chambers cones gallery intervals lunes and other geometric notions associated with arrangements The Tits monoid plays a central role Another important object is the category of lunes which generalizes the classical associative operad Also discussed are the descent and lune identities distance functions on chambers and the combinatorics of the braid arrangement and related examples Part II studies the structure and representation theory of the Tits algebra of an arrangement It gives a detailed analysis of idempotents and Peirce decompositions and connects them to the classical theory of Eulerian idempotents It introduces the space of Lie elements of an arrangement which generalizes the classical Lie operad This space is the last nonzero power of the radical of the Tits algebra It is also the socle of the left ideal of chambers and of the right ideal of Zie elements Zie elements generalize the classical Lie idempotents They include Dynkin elements associated to generic half spaces which generalize the classical Dynkin idempotent Another important object is the lune incidence algebra which marks the beginning of noncommutative Möbius theory These ideas are also brought upon the study of the Solomon descent algebra The monograph is written with clarity and in sufficient detail to make it accessible to graduate students It can also serve as a useful reference to experts
