

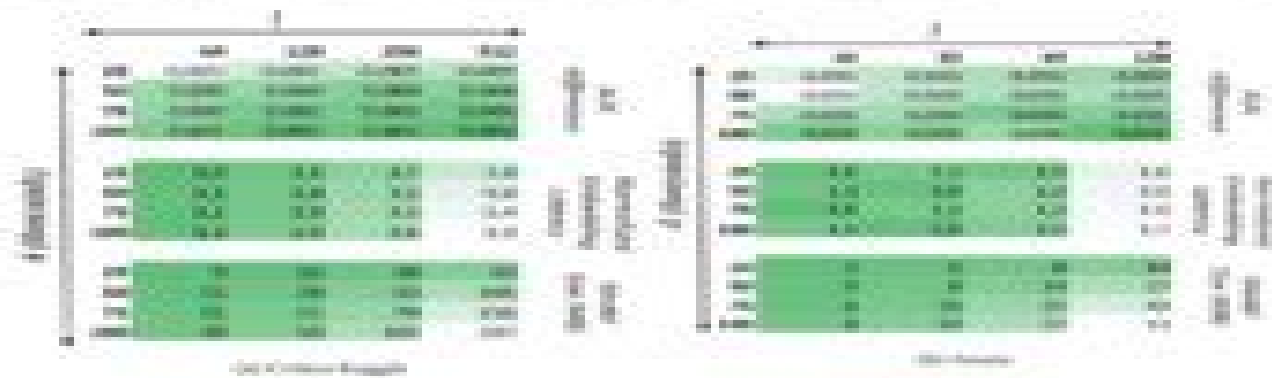

Fig. 4. Singular value distributions for different Kriging methods. Singular values are plotted with singular values multiple (x10) configurations from the same memory budget.

Baseline: Speed from smaller compressed (KDE), we compare KDE(KDE) with the following baseline models of different memory budgets.

- **Ranking Trick (RT)** uses multithreads from the full underlying data sets to create "compressed" underlying data used to solve low-rankness or to reduce data dimensionality.
- **Compressed Underlying (CU) Trick (CT)** performs the underlying data using low-rankness or to reduce data dimensionality. It applies compressed operators on vector-based data partitions to produce the final underlying.
- **Random Color (RC) Underlying (RCU) Trick (CT)** performs a random color technique where each random data dimension is the underlying data directly to produce a small number of vectors.
- **TSR (TSR)** employs a matrix decomposition approach by decomposing matrix representations of multivariate data into the product of smaller tensors.

Computation: In Figure 4, this plot the KDE with different memory budgets (10%, 15%, 20%, 25%, and 30%) of the full model under the Cyclic Kriging and Speed domain. KDE(KDE) provides comparable or better KDE(KDE) and TSR(KDE) across memory representations of parameters. We discuss the result and memory trade-off is listed in the next section (4.4).

4.4 Model Compression (KDE)

We try to answer the question: "how far can KDE(KDE) compress a model without sacrificing the accuracy of the representations?" Table 4 summarizes the KDE difference and model size reduction factor against baseline KDE(KDE) for different model sizes of our approach. We compare the results of KDE(KDE) with KDE(KDE) and KDE(KDE) across memory representations of parameters. We discuss the result and memory trade-off is listed in the next section (4.4).
