Progress in Optics, 1992-06-26 Confirming the fact that optics continues to be a highly active field of research where many interesting developments are currently taking place the latest volume in this renowned series presents five review articles by well known experts on topics of current interest in optics The first article concerns quantum fluctuations a phenomenon encountered directly or indirectly in all optical measurements Such fluctuations set limits to attainable accuracy with which measurements can be made In recent years theoretical as well as experimental research has demonstrated that limitations arising from quantum fluctuations can sometimes be circumvented to some extent These developments are of importance from the standpoint of basic physics as well as in connection with technological applications such as noise reduction in communication systems The second article deals with correlation holographic interferometry and speckle photography paying special attention to the effects of random variation of surface microstructure on the contrast of interference fringes The article which follows covers an important subject in the broad area of wave propagation in random media namely wave localization This phenomenon is a subtle manifestation of interference of multiply scattered waves and provides information about important properties of disordered systems The article considers mainly localization in one dimensional systems which elucidate some of the underlying physics The fourth

article discusses an important nonlinear phenomenon namely soliton propagation in fibres Solitons are pulses which can propagate over long distances without change in shape Because of their considerable stability they are of particular interest for communication systems The concluding article presents the theory and describes experiments on elementary quantum systems in the context of cavity quantum optics Such experiments are providing deeper understanding of the interaction of light with matter and give new insights into the foundations of quantum mechanics Progress in Optics Emil Wolf,2003-07 Progress in Optics Volume 45 *Progress in Optics* Taco Visser,2016-04-08 The Progress in Optics series contains more than 300 review articles by distinguished research workers which have become permanent records for many important developments helping optical scientists and optical engineers stay abreast of their fields Comprehensive in depth reviews Edited by the leading authority in the field **A History of Spectroscopy** Emile Biémont,2025-11-28 Understanding the nature of light is a fundamental question that has troubled mankind since antiquity It took a great deal of speculation and study concerning the formation of the rainbow to formulate the right hypotheses to explain the iridescence observed when white light passes through raindrops or pieces of glass For a long time ancient philosophers were far more interested in the propagation of the light than in its nature A History of Spectroscopy retraces the major stages in the growth of the various spectroscopic methods from their origins as well as the most recent advances and the hopes they raise for future technological progress With its multidisciplinary aspects it embodies a masterly and unique effort which has no equivalent in the published literature The present contribution will be read with profit not only by students embarking on a career in physics in general and in spectroscopy or astrophysics more specifically but also by students in many other related fields like chemistry biology medicine pharmacy and engineering Key Features The most extensive and detailed book on the history of spectroscopy Covers a period of several centuries extending from Newton up to the present day Discusses recent progress in different fields and subfields of physics and more specifically in the domain of the analysis of the light
