

agement plan is adopted. In some cases, the development of water supply from coastal rivers is contingent on avoiding adverse environmental impacts. This may involve withdrawing no water from streams during periods of low flow. In such cases, a conjunctive use scheme may be the only way to increase regional safe yield with moderate cost.

These circumstances illustrate some functional advantages of regionalization, which, with scale and other operational advantages described by the author, cause it to be considered more and more. It may be added that regionalization may not always be in the public interest. It may be advocated for quite different reasons, including the desire of ambitious managers, either of public or investor-owned systems, to increase the scale of the operations under their control.

### Closure by Neil S. Grigg,<sup>3</sup> Fellow, ASCE

In this closure I would like to address the issue of water management integration. Its complexity can be fathomed by using a classification system for examples of water management integration. Whipple's discussion adds interesting examples of regionalization to the original paper. New Jersey is an apparent leader in innovating with regionalization concepts in water-supply management, and I would like to comment later on how the examples fit into different categories of water management integration.

As discussed in the original paper, the concept of regionalization is closely related to the term *integration* as it relates to the water-supply industry. The definition presented in the original paper was "regionalization in water management is integration or cooperation on a regional basis." As examples such as those cited by Whipple emerge, it seems useful to classify water management integration, and the following five types are apparent: political, functional, hydrologic-ecologic, geographic, and disciplinary. Using these classifications can provide illumination for the complex subject of integration in water management.

Political integration can be either horizontal, where agencies at the same level of government integrate efforts, or vertical, where agencies at different levels of government integrate efforts. Functional integration means to integrate the functions or purposes of water management. The term is closely related to multipurpose water management, depending on the degree of actual integration.

Hydrologic-ecologic integration in water management covers the hydrologic and biologic systems. For example, conjunctive management of ground and surface water is hydrologic integration. Managing water quantity and quality together, while basically an example of functional integration, also aims to manage aquatic ecological systems.
