Trafficking Inside Cells Nava Segev, 2010-05-30 This book covers the past present and future of the intra cellular trafficking field which has made a quantum leap in the last few decades It details how the field has developed and evolved as well as examines future directions **Cumulated Index Medicus**, 1994 **Endocytosis and Signaling** Christophe

Lamaze, Ian Prior, 2018-08-10 This book focuses on the context dependency of cell signaling by showing how the endosomal system helps to structure and regulate signaling pathways The location and concentration of signaling nodes regulate their activation cycles and engagement with distinct effector pathways Whilst many cell signaling pathways are initiated from the cell surface endocytosis provides an opportunity for modulating signaling networks output In this book first a series of reviews describe the endocytic and endosomal system and show how these subcellular platforms sort and regulate a wide range of signaling pathway components and phenotypic outputs The book then reviews the latest scientific insights into how endocytic trafficking and subcellular location modulate a set of major pathways that are essential to normal cellular function and organisms development **Rab GTPases and Membrane Trafficking** Guangpu Li, Nava Segev, 2012-05-21 Ypt Rab

Biology and Pathogenesis of Legionella Hayley Newton, Elizabeth Hartland, Matthias Machner, 2018-12-07 Legionella pneumophila was first isolated as the causative agent of a deadly infectious pneumonia at a convention of the American Legion forty years ago. Since then, Legionnaires' disease continues to be a significant public health concern. Today, our understanding of the Legionella genus, comprising environmental bacteria and opportunistic human pathogens, has dramatically increased. The study of how pathogenic Legionella interact with host cells, both protozoan and mammalian, has not only taught us about host-pathogen interactions but has revealed novel and unexpected insights into human cell biology and immunology. The capacity of pathogenic Legionella to commandeer cellular processes such as eukaryotic vesicular trafficking to establish an ER-like replicative niche reflects the exquisite ability of this pathogen to manipulate eukaryotic cell biology in order to replicate in an intracellular compartment. This requires the specific and

targeted action of a cohort of translocated bacterial effector proteins In addition we have learnt much about cell autonomous innate immune sensing of intracellular bacteria through the inability of *L pneumophila* to avoid intracellular mammalian defense mechanisms Now in the age of large scale comparative omics it is clear that different *Legionella* species utilize different cohorts of effectors to replicate inside eukaryotic cells While we understand some of the strategies employed by *L pneumophila* and *L longbeachae* to replicate within eukaryotic cells there is still much to learn about many aspects of the *Legionella* life cycle This Research Topic highlights the latest findings regarding the biology of *Legionella* species their interactions with eukaryotic host cells and how the application of various technologies has increased our understanding of this important pathogen
