Relativity The Special And General Theory:

Relativity Albert Einstein, Robert W. Lawson, 2001-01-01 This book contains the great physicist's own explanation of both the special and general theories of relativity. Written for readers interested in the theory but not conversant with the mathematical apparatus of theoretical physics, it presents the ideas in their simplest, most intelligible form. **Relativity** Albert Einstein, 1920 **Relativity** Albert Einstein, Robert W. Lawson, 2001 In this famous short book, Einstein explains clearly using the minimum amount of mathematical terms the basic ideas and principles of the theory which has shaped the world we live in today. *Relativity* Albert Einstein, 2013-07-04 Time magazine's Man of the Century: Albert Einstein is the founder of modern physics and his theory of relativity is the most important scientific idea of the modern era. In this short book, Einstein explains using the minimum of mathematical terms the basic ideas and principles of the theory that has shaped the world we live in today. Unsurpassed by any subsequent books on relativity, this remains the most popular and useful exposition of Einstein's immense contribution to human knowledge. With a new foreword by Derek Raine. *Relativity* Albert Einstein, 2017-09-03 **Relativity The Special and General Theory** **Relativity - the Special and General Theory** Albert Einstein, 2017-10-21 *Relativity The Special and the General Theory* began as a short paper and was eventually published as a book written by Albert Einstein with the aim of giving an exact insight into the theory of relativity to those readers who from a general scientific and philosophical point of view are interested in the theory but who are not conversant with the mathematical apparatus of theoretical physics. It was first published in German in 1916 and later translated into English in 1920. It is divided into 3 parts: the first dealing with special relativity, the second dealing with general relativity, and the third dealing with considerations on the universe as a whole. **The Special and General Theory** Albert Einstein, 1948-01-01 How better to learn the Special Theory of Relativity and the General Theory of Relativity than directly from their creator, Albert Einstein himself? In *Relativity The Special and the General Theory*, Einstein describes the theories that made him famous, illuminating his case with numerous examples and a smattering of math, nothing more complex than high school algebra. Einstein's book is not casual reading, but for those who appreciate his work without diving into the arcana of theoretical physics, *Relativity* will prove a stimulating read. The present book is intended, Einstein wrote in 1916, as far as possible to give an exact insight into the theory of Relativity to those readers who from a general scientific and philosophical point of view are interested in the theory but who are not conversant with the mathematical apparatus of theoretical physics. *The Special and General Theory* by Albert Einstein. *The Special and General Theory* is Albert Einstein's groundbreaking work that revolutionized the field of physics. In this seminal book, Einstein presents his theories of relativity, offering profound insights into the fundamental nature of space, time, and gravity. With clarity and intellectual rigor, Einstein's work continues to be a cornerstone of modern physics and a testament to his genius. **Key Aspects of the Book: The Special and General Theory** *Theory of Relativity*. Einstein's book delves into the concepts of special and general relativity, providing a comprehensive

Relativity - the Special and General Theory/ Sidelights on Relativity Albert Einstein, 2017-10-25 Relativity The Special and General Theory Sidelights on Relativity is a compilation of two classic Albert Einstein physics papers Special relativity is a theory of the structure of spacetime It was introduced in Einstein's 1905 paper On the Electrodynamics of Moving Bodies for the contributions of many other physicists see History of special relativity Special relativity is based on two postulates which are contradictory in classical mechanics The laws of physics are the same for all observers in uniform motion relative to one another principle of relativity The speed of light in a vacuum is the same for all observers regardless of their relative motion or of the motion of the light source The resultant theory copes with experiment better than classical mechanics For instance postulate 2 explains the results of the Michelson Morley experiment Moreover the theory has many surprising and counterintuitive consequences Some of these are Relativity of simultaneity Two events simultaneous for one observer may not be simultaneous for another observer if the observers are in relative motion Time dilation Moving clocks are measured to tick more slowly than an observer's stationary clock Length contraction Objects are measured to be shortened in the direction that they are moving with respect to the observer Maximum speed is finite No physical object message or field line can travel faster than the speed of light in a vacuum The effect of Gravity can only travel through space at the speed of light not faster or instantaneously Mass energy equivalence $E = mc^2$ energy and mass are equivalent and transmutable Relativistic mass idea used by some researchers The defining feature

of special relativity is the replacement of the Galilean transformations of classical mechanics by the Lorentz transformations. General relativity is a theory of gravitation developed by Einstein in the years 1907-1915. The development of general relativity began with the equivalence principle under which the states of accelerated motion and being at rest in a gravitational field, for example when standing on the surface of the Earth, are physically identical. The upshot of this is that free fall is inertial motion: an object in free fall is falling because that is how objects move when there is no force being exerted on them, instead of this being due to the force of gravity as is the case in classical mechanics. This is incompatible with classical mechanics and special relativity because in those theories inertially moving objects cannot accelerate with respect to each other, but objects in free fall do so. To resolve this difficulty, Einstein first proposed that spacetime is curved. In 1915 he devised the Einstein field equations which relate the curvature of spacetime with the mass-energy and any momentum within it. Some of the consequences of general relativity are: Clocks run slower in deeper gravitational wells. This is called gravitational time dilation. Orbits precess in a way unexpected in Newton's theory of gravity. This has been observed in the orbit of Mercury and in binary pulsars. Rays of light bend in the presence of a gravitational field. Rotating masses drag along the spacetime around them, a phenomenon termed frame dragging. The universe is expanding and the far parts of it are moving away from us faster than the speed of light. Technically, general relativity is a theory of gravitation whose defining feature is its use of the Einstein field equations. The solutions of the field equations are metric tensors which define the topology of the spacetime and how objects move inertially.
