Readily available analysis techniques allow us to obtain sophisticated item analysis data for music items

Item Response Theory models should become the standard analysis approach

3 parameter models for dichotomous items which measure difficulty and discrimination while controlling for guessing

Polytomous generalized rating scale models extend IRT theory to the analysis of rubric-based assessments (i.e. Samejima's graded response model)

Easy software programs such as XCalibre4™ make these complex calculations accessible

The internal validity of a study reflects the extent to which the design and conduct of the study have prevented biases. One of the key steps in a systematic review is assessment of a study's internal validity or potential for bias. This assessment serves to:

- 1 identify the strengths and limitations of the included studies
- 2 investigate and potentially explain heterogeneity in findings across different studies included in a systematic review
- 3 grade the strength of evidence for a given question

The risk of bias assessment directly informs one of four key domains considered when assessing the strength of evidence. With the increase in the number of published systematic reviews and development of systematic review methodology over the past 15 years, close attention has been paid to the methods for assessing internal validity. Until recently, this has been referred to as quality assessment or assessment of methodological quality. In this context, quality refers to the confidence that the trial design, conduct, and analysis has minimized or avoided biases in its treatment comparisons. To facilitate the assessment of methodological quality, a plethora of tools has emerged. Some of these tools were developed for specific study designs (e.g., randomized controlled trials, RCTs, cohort studies, case control studies), while others were intended to be applied to a range of designs. The tools often incorporate characteristics that may be associated with bias; however, many tools also contain elements related to reporting (e.g., was the study population described and design (e.g., was a sample size calculation performed) that are not related to bias. The Cochrane Collaboration recently developed a tool to assess the potential risk of bias in RCTs. The Risk of Bias (ROB) tool was developed to address some of the shortcomings of existing quality assessment instruments, including over-reliance on reporting rather than methods. Several systematic reviews have catalogued and critiqued the numerous tools available to assess methodological quality or risk of bias of primary studies. In summary, few existing tools have undergone extensive inter-rater reliability or validity testing. Moreover, the focus of much of the tool development or testing that has been done has been on criterion or face validity. Therefore, it is unknown whether or to what extent the summary assessments based on these tools differentiate between studies with biased and unbiased results (i.e., studies that may over or underestimate treatment effects). There is a clear need for inter-rater reliability testing of different tools in order to enhance consistency in their application and interpretation across different systematic reviews. Further validity testing is essential to ensure that the tools being used can

identify studies with biased results Finally there is a need to determine inter rater reliability and validity in order to support the uptake and use of individual tools that are recommended by the systematic review community and specifically the ROB tool within the Evidence based Practice Center EPC Program In this project we focused on two tools that are commonly used in systematic reviews The Cochrane ROB tool was designed for RCTs and is the instrument recommended by The Cochrane Collaboration for use in systematic reviews of RCTs The Newcastle Ottawa Scale is commonly used for nonrandomized studies specifically cohort and case control studies

*The First 1000 Days in the Nordic Countries: Psychosocial Interventions and Psychological Tests: A Review of the Evidence* Breivik, Kyrre,Eng, Helene,Kaiser, Sabine,Karjalainen, Piia,Kurki, Marjo,Kyrrestad, Henriette,Laaajasalo, Taina,Martinussen, Monica,Merikukka, Marko,Peltonen, Kirsi,Pettersen, Susann Dahl,Rasmussen, Lene-Mari P.,Reedtz, Charlotte,Rye, Marte,2021-06-22 Available online <https://pub.norden.org/nord2021/037> The report provides an overview and short systematic review of the psychosocial interventions and psychological tests used in the Nordic countries during the first

1000 days of a child's life i.e. from the prenatal period until two years of age. A total of 63 interventions and 33 tests were reviewed. Findings reveal that although a large number of interventions and tests are available for the target groups in the Nordic countries, evidence regarding their effectiveness or psychometric properties is often lacking or insufficient. Thus, it is important that research efforts be enhanced in the Nordic region to strengthen the evidence base of the interventions and instruments that practitioners rely upon in order to assess and support mental wellbeing for Nordic children and families during this critical period in their lives.
