Chemometrics in Food Chemistry, 2013-06-08 The issues related to food science and authentication are of particular importance for researchers consumers and regulatory entities The need to guarantee quality foodstuff where the word quality encompasses many different meanings including e g nutritional value safety of use absence of alteration and adulterations genuineness typicalness etc has led researchers to look for increasingly effective tools to investigate and deal with food chemistry problems As even the simplest food is a complex matrix the way to investigate its chemistry cannot be other than multivariate

Therefore chemometrics is a necessary and powerful tool for the field of food analysis and control. For food science in general and food analysis and control in particular there are several problems for which chemometrics are of utmost importance. Traceability, i.e. the possibility of verifying the animal botanical geographical and/or productive origin of a foodstuff, is for instance one area where the use of chemometric techniques is not only recommended but essential. Indeed at present no specific chemical and/or physico-chemical markers have been identified that can be univocally linked to the origin of a foodstuff and the only way of obtaining reliable traceability is by means of multivariate classification applied to experimental fingerprinting results. Another area where chemometrics is of particular importance is in building the bridge between consumer preferences, sensory attributes and molecular profiling of food by identifying latent structures among the data tables. Bilinear modeling techniques such as PCA, MCR, PLS and its various evolutions can provide an interpretable and reliable connection among these domains. Other problems include process control and monitoring the possibility of using RGB or hyperspectral imaging techniques to nondestructively check food quality calibration of multidimensional or hyphenated instruments etc.

Big Data in Predictive Toxicology Daniel Neagu, Andrea-Nicole Richarz, 2019-12-04 The rate at which toxicological data is generated is continually becoming more rapid and the volume of data generated is growing dramatically. This is due in part to advances in software solutions and cheminformatics approaches which increase the availability of open data from chemical, biological and toxicological and high throughput screening resources. However the amplified pace and capacity of data generation achieved by these novel techniques presents challenges for organising and analysing data output. *Big Data in Predictive Toxicology* discusses these challenges as well as the opportunities of new techniques encountered in data science. It addresses the nature of toxicological big data, their storage, analysis and interpretation. It also details how these data can be applied in toxicity prediction, modelling and risk assessment. This title is of particular relevance to researchers and postgraduates working and studying in the fields of computational methods applied and physical chemistry, cheminformatics, biological sciences, predictive toxicology and safety and hazard assessment.
