Optical Properties of Diamond A.M. Zaitsev, 2013-03-09 The unique properties of diamond are responsible for its pre eminence as a gemstone and give it a glamour and attraction unprecedented for any other mineral As the first member of group IV of the periodic table of elements carbon in its crystalline form as diamond has also fascinated scientists for at least 300 years Many experimental techniques have been

employed in the study of diamond and of these optical spectroscopy has proven one of the most fruitful The absorption line at 415 nm characteristic of Cape Yellow diamonds was first documented by Walter in 1891 Further work on this absorption now known as N3 by the Indian school under Sir C V Raman in the 1930s and 1940s led to a basic understanding of the system which they observed in both absorption and luminescence The N3 center is a structural defect in the diamond and the absorption of light occurs by exciting electrons in this defect from one well defined energy state to another When the electron returns to the original energy level luminescence is produced Detailed studies of natural diamonds over the subsequent 60 years have discovered large numbers of absorption and emission lines characteristic of different defects In 1904 Sir William Crookes showed that a colorless diamond could be turned green by long exposure to radium salts

Fluorescent Nanodiamonds Huan-Cheng Chang, Wesley Wei-Wen Hsiao, Meng-Chih Su, 2018-09-12 The most comprehensive reference on fluorescent nanodiamond physical and chemical properties and contemporary applications Fluorescent nanodiamonds FNDs have drawn a great deal of attention over the past several years and their applications and development potential are proving to be manifold and vast The first and only book of its kind *Fluorescent Nanodiamonds* is a comprehensive guide to the basic science and technical information needed to fully understand the fundamentals of FNDs and their potential applications across an array of domains In demonstrating the importance of FNDs in biological applications the authors bring together all relevant chemistry physics materials science and biology Nanodiamonds are produced by powerful cataclysmic events such as explosions volcanic eruptions and meteorite impacts They also can be created in the lab by high pressure high temperature treatment of graphite or detonating an explosive in a reactor vessel A single imperfection can give a nanodiamond a specific isolated color center which allows it to function as a single trapped atom Much smaller than the thickness of a human hair a nanodiamond can have a huge surface area that allows it to bond with a variety of other materials Because of their non toxicity nanodiamonds may be useful in biomedical applications such as drug delivery and gene therapy The most comprehensive reference on a topic of rapidly increasing interest among academic and industrial researchers across an array of fields Includes numerous case studies and practical examples from many areas of research and industrial applications as well as fascinating and instructive historical perspectives Each chapter addresses in depth a single integral topic including the fundamental properties synthesis mechanisms and functionalisation of FNDs The first book published by the key patent holder with his research group in the field of FNDs *Fluorescent Nanodiamonds* is an important working resource for a broad range of scientists and engineers in industry and academia It will also be a welcome reference for instructors in chemistry physics materials science biology and related fields
