Navigating The Tmdl Proceb Listing And Delisting:

Navigating the TMDL Process Paul L. Freedman, 2003-12-01 Narrative water quality criteria are an integral component of States water quality standards but they pose special problems when incorporated into the TMDL process The TMDL process is typically a quantitative activity defining numeric allowable loads necessary to meet a numeric water quality objective Narrative criteria confound development of quantitative TMDLs due to the absence of these numeric criteria The objective of this research was to improve the methods for addressing narrative water quality criteria in the TMDL process The problems associated with narrative criteria in the TMDL process are known in general terms but prior to this research there has not been a thorough review of the use of narrative criteria in TMDLs nor broad guidance on how to address narrative criteria in the TMDL process The approach taken for this research was to define the range of problems associated with all types of narrative criteria by means of a comprehensive review of 120 narrative TMDLs and provide guiding principles to help address these problems

Navigating the TMDL Process J. Hyde, 2003-06-30 This report offers recommendations for improving the listing and delisting process emerging from surveys of 8 states and review discussion with other selected states The report evaluates alternatives and options for reducing uncertainty in each of the four major listing delisting elements including WQS designated uses and water quality criteria water quality data acquisition comparative methodology list content and format Based on these state surveys reviews of the FACA Committee NRC Subcommittee on TMDLs and Water Quality Management and Project Team experience the report proposes a set of minimum activities a number of alternatives and options and a comprehensive approach for reducing uncertainty in the listing and delisting process

Mississippi River Water Quality and the Clean Water Act National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on the Mississippi River and the Clean Water Act, 2008-02-08 The Mississippi River is in many ways the nation s best known and most important river system Mississippi River water quality is of paramount importance for sustaining the many uses of the river including drinking water recreational and commercial activities and support for the river s ecosystems and the environmental goods and services they provide The Clean Water Act passed by Congress in 1972 is the cornerstone of surface water quality protection in the United States employing regulatory and nonregulatory measures designed to reduce direct pollutant discharges into waterways The Clean Water Act has reduced much pollution in the Mississippi River from point sources such as industries and water treatment plants but problems stemming from urban runoff agriculture and other non point sources have proven more difficult to address This book concludes that too little coordination

among the 10 states along the river has left the Mississippi River an orphan from a water quality monitoring and assessment perspective Stronger leadership from the U S Environmental Protection Agency EPA is needed to address these problems Specifically the EPA should establish a water quality data sharing system for the length of the river and work with the states to establish and achieve water quality standards The Mississippi River corridor states also should be more proactive and cooperative in their water quality programs For this effort the EPA and the Mississippi River states should draw upon the lengthy experience of federal interstate cooperation in managing water quality in the Chesapeake Bay [Book Review Index](#),2006 Every 3rd issue is a quarterly cumulation *Oakland Harbor Inner and Outer Deep Navigation (-50 Foot) Improvement Project* ,1998 [The British National Bibliography](#) Arthur James Wells,2005 [Proceedings of the Annual Meeting - Upper Mississippi River Conservation Committee](#) Upper Mississippi River Conservation Committee. Meeting,Upper Mississippi River Conservation Committee,2007 **Designation of Dredged Material Disposal Sites in Central and Western Long Island Sound, Connecticut and New York** ,2004 **Navigating the TMDL Process** P. L. Freedman,Wm Larson,Dw Dilks,2003 The objective of this research was to review the e *The Twenty Needs Report* ,2002 **Assessing the TMDL Approach to Water Quality Management** National Research Council,Division on Earth and Life Studies,Water Science and Technology Board,Committee to Assess the Scientific Basis of the Total Maximum Daily Load Approach to Water Pollution Reduction,2001-08-24 Over the last 30 years water quality management in the United States has been driven by the control of point sources of pollution and the use of effluent based water quality standards Under this paradigm the quality of the nation s lakes rivers reservoirs groundwater and coastal waters has generally improved as wastewater treatment plants and industrial dischargers point sources have responded to regulations promulgated under authority of the 1972 Clean Water Act These regulations have required dischargers to comply with effluent based standards for criteria pollutants as specified in National Pollutant Discharge Elimination System NPDES permits issued by the states and approved by the U S Environmental Protection Agency EPA Although successful the NPDES program has not achieved the nation s water quality goals of fishable and swimmable waters largely because discharges from other unregulated nonpoint sources of pollution have not been as successfully controlled Today pollutants such as nutrients and sediment which are often associated with nonpoint sources and were not considered criteria pollutants in the Clean Water Act are jeopardizing water quality as are habitat destruction changes in flow regimes and introduction of exotic species This array of challenges has shifted the focus of water quality management from effluent based to ambient based water quality standards Given the most recent lists of impaired waters submitted to EPA there are about 21 000 polluted river segments lakes and estuaries making up over 300 000 river and shore miles and 5 million lake acres The number of TMDLs required for these impaired waters is greater than 40 000 Under the 1992 EPA guidance or the terms of lawsuit settlements most states are required to meet an 8 to 13 year deadline for completion of TMDLs Budget requirements for the program are staggering as well with most states claiming

that they do not have the personnel and financial resources necessary to assess the condition of their waters to list waters on 303d and to develop TMDLs A March 2000 report of the General Accounting Office GAO highlighted the pervasive lack of data at the state level available to set water quality standards to determine what waters are impaired and to develop TMDLs This report represents the consensus opinion of the eight member NRC committee assembled to complete this task The committee met three times during a three month period and heard the testimony of over 40 interested organizations and stakeholder groups The NRC committee feels that the data and science have progressed sufficiently over the past 35 years to support the nation s return to ambient based water quality management Given reasonable expectations for data availability and the inevitable limits on our conceptual understanding of complex systems statements about the science behind water quality management must be made with acknowledgment of uncertainties This report explains that there are creative ways to accommodate this uncertainty while moving forward in addressing the nation s water quality challenges

Navigating the TMDL Process P. L. Freedman,2003-01-01 *Navigating the TMDL Process* P. L. Freedman,2003-01-01 **Navigating the TMDL Process** R. Tjeerdema,2007-09-30 A key step in the development of Total Maximum Daily Load TMDL allocations for water bodies impaired due to sediment toxicity is the identification of chemicals responsible for toxicity Sediment toxicity identification evaluation procedures TIEs are one of the primary tools used in this process This project evaluated standardized and recently developed sediment TIE methods developed by the US EPA and others to determine their utility for identifying chemicals responsible for toxicity In this study formulated sediments were spiked with five chemicals copper fluoranthene tetrachlorobenzene nonylphenol and ammonia Experiments were conducted using sediments spiked with single chemicals and chemical mixtures Toxicity tests used the estuarine amphipod *Eohaustorius estuarius* and the freshwater amphipod *Hyalella azteca* TIEs were conducted using solid phase whole sediment and sediment interstitial waters Results indicate that the TIE methods are sufficient to characterize and identify toxicity due to single and multiple chemicals using spiked sediments One key finding from the spiked sediment experiments is that methods to elute chemicals from extraction media used in solid phase and interstitial water TIEs require further refinement to ensure complete and consistent elution of sorbed chemicals An additional finding is that both solid phase and interstitial water TIE procedures provide useful lines of evidence and that both approaches should be used in a weight of evidence approach in the sediment TIE process In the final phase of this project we evaluated the TIE procedures using ambient samples collected from three marine sites and three freshwater sites Marine sediments were collected from Switzer Creek in San Diego Bay Upper Newport Bay in Newport Beach and Consolidated Slip in Long Beach Harbor all of which are sites in southern California Freshwater sediments were collected from two additional sites in California San Diego Creek in Newport Beach and Alisal Slough in Salinas The final freshwater sediment was collected from a site in Indiana Harbor Multiple solid phase and interstitial water TIEs were conducted on each sediment and results of these were combined with chemical analyses and other lines of evidence to

evaluate the methods The results indicate that sediment TIE methods are sufficiently developed to characterize toxicity due to general classes of chemicals such as cationic metals organic chemicals and ammonia Methods to improve extraction and elution of metal and organic chemicals in highly toxic sediments require further refinement in order to allow identification of specific chemicals responsible for toxicity as part of the Phase II TIE process These refinements include determining the appropriate masses of solid phase extraction media to allow complete removal of toxic chemicals from sediments and interstitial waters In addition we recommend that additional studies be designed to determine optimal equilibration periods to maximize removal of toxic chemicals using resin amendments in solid phase sediment TIEs As in the spiked sediment TIEs we observed inconsistent elution of toxic chemicals from extraction media used in solid phase and interstitial water Phase II TIEs with the ambient samples These procedures require additional work to ensure that chemicals responsible for toxicity are completely eluted from extraction media Improvement of the Phase II TIE elution and solvent handling steps should facilitate better identification of chemicals responsible for toxicity particularly in situations where toxicity is due to highly insoluble chemicals When these considerations are satisfactorily addressed the methods evaluated are capable of providing useful lines of evidence that can be combined to successfully identify sediment toxicants
