Reasoning And Thinking:

Thinking and Reasoning: A Very Short Introduction Jonathan St B. T. Evans, 2017-09-21 Our extraordinary capacity to reason and solve problems sets us aside from other animals but our evolved thinking processes also leave us susceptible to bias and error The study of thinking and reasoning goes back to Aristotle and was one of the first topics to be studied when psychology separated from philosophy In this Very Short Introduction Jonathan Evans explores cognitive psychological approaches to understanding the nature of thinking and reasoning problem solving and decision making He shows how our problem solving capabilities are hugely dependent on also having the imagination to ask the right questions and the ability to see things from a completely new perspective Beginning by considering the approaches of the behaviourists and the Gestalt psychologists he moves on to modern explorations of thinking including hypothetical thinking conditionals deduction rationality and intuition Covering the role of past learning IQ and cognitive biases Evans also discusses the idea that there may be two different ways of thinking arising from our evolutionary history ABOUT THE SERIES The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area These pocket sized books are the perfect way to get ahead in a new subject quickly Our expert authors combine facts analysis perspective new ideas and enthusiasm to make interesting and challenging topics highly readable Thinking and Reasoning (Psychology Revivals) Jonathan St. B. T. Evans, 2013-12-19 The subject of thinking is the oldest in the whole science of psychology going back to well before the separation of the disciplines of philosophy and psychology Originally published in 1983 this collection of up to date critical essays about thinking with particular emphasis on reasoning is written from the perspective of psychologists who are themselves actively engaged in research into the nature of human thought The editor's introduction identifies the major issues which have traditionally concerned students of human thought and provides an historical background It describes how at first the subject was studied by introspection and how this method fell into disrepute at the end of last century A satisfactory alternative has not yet emerged although much recent work is based on the information processing model which sees the brain as a sophisticated computer Consequently the papers presented in this volume deal with a wide range of issues and a number of different experimental tasks and paradigms They cover most current approaches to the theory and methodology of cognitive psychology including problem solving the relationship between language and thought and reasoning Reasoning and Thinking K. I. Manktelow, 1999 This undergraduate textbook reviews psychological research in the major areas of reasoning and thinking deduction induction hypothesis testing probability judgement and decision making It also covers the major theoretical debates in each area and devotes a chapter to one of the liveliest issues in the field the question of human rationality Central themes that recur throughout the book include not only rationality but also the relation between normative theories such as logic probability theory and decision theory and human performance both in experiments and in the world outside the laboratory No prior acquaintance with formal systems is assumed and

everyday examples are used throughout to illustrate technical and theoretical points The book differs from others in the market firstly in the range of material covered other tend to focus primarily on either reasoning or thinking It is also the first student level text to survey an important new theoretical perspective the information gain or rational analysis approach and to review the rationality debate from the standpoint of psychological research in a wide range of areas **The**

Rationality and Reasoning Jonathon St. B.T. Evans, David E. Over, 2013-09-13 This book addresses an apparent paradox in the psychology of thinking On the one hand human beings are a highly successful species On the other intelligent adults are known to exhibit numerous errors and biases in laboratory studies of reasoning and decision making There has been much debate among both philosophers and psychologists about the implications of such studies for human rationality The authors argue that this debate is marked by a confusion between two distinct notions a personal rationality rationality¹ Evans and Over argue that people have a high degree of rationality¹ but only a limited capacity for rationality² The book re interprets the psychological literature on reasoning and decision making showing that many normative errors by abstract standards reflect the operation of processes that would normally help to achieve ordinary goals Topics discussed include relevance effects in reasoning and decision making the influence of prior beliefs on thinking and the argument that apparently non logical reasoning can reflect efficient decision making The authors also discuss the problem of deductive competence whether people have it and what mechanism

can account for it As the book progresses increasing emphasis is given to the authors dual process theory of thinking in which a distinction between tacit and explicit cognitive systems is developed It is argued that much of human capacity for rationality¹ is invested in tacit cognitive processes which reflect both innate mechanisms and biologically constrained learning However the authors go on to argue that human beings also possess an explicit thinking system which underlies their unique if limited capacity to be rational
