Materials for High-Temperature Fuel Cells San Ping Jiang, Yushan Yan, 2013-04-11 The world's ever growing demand for power has created an urgent need for new efficient and sustainable sources of energy and electricity. Today's consumers of portable electronics also demand devices that not only deliver more power but are also environmentally friendly. Fuel cells are an important alternative energy source with promise in military commercial and industrial applications for example power vehicles and portable devices. A fuel cell is an electrochemical device that directly converts the chemical energy of a fuel into electrical energy. Fuel cells represent the most efficient energy conversion technologies to date and are an integral part in the new and renewable energy chain e.g. solar wind and hydropower. Fuel cells can be classified as either high temperature or low temperature depending on their operating temperature and have different materials requirements. This book is dedicated to the study of high temperature fuel cells. In high temperature fuel cells the electrolyte materials are ceramic or molten carbonate while the electrode materials are ceramic or metal but not precious metal. High operation temperature fuel cells allow internal reforming promote rapid kinetics with non precious materials and offer high flexibilities in fuel choice and are potential and viable candidate to moderate the fast increase in power requirements and to minimize the impact of the increased power consumption on the environment. *Materials for High Temperature Fuel Cells* is part of the series on *Materials for Sustainable Energy and Development* edited by Prof. Max Q. Lu. The series covers advances in materials science and innovation for renewable energy clean use of fossil energy and greenhouse gas mitigation and associated environmental technologies.

Interactive Data Processing and 3D Visualization of the Solid Earth Daniel

Patel,2022-02-21 This book presents works detailing the application of processing and visualization techniques for analyzing the Earth's subsurface. The topic of the book is interactive data processing and interactive 3D visualization techniques used on subsurface data. Interactive processing of data together with interactive visualization is a powerful combination which has in the recent years become possible due to hardware and algorithm advances. The combination enables the user to perform interactive exploration and filtering of datasets while simultaneously visualizing the results so that insights can be made immediately. This makes it possible to quickly form hypotheses and draw conclusions. Case studies from the geosciences are not as often presented in the scientific visualization and computer graphics community as e.g. studies on medical biological or chemical data. This book will give researchers in the field of visualization and computer graphics valuable insight into the open visualization challenges in the geosciences and how certain problems are currently solved using domain specific processing and visualization techniques. Conversely readers from the geosciences will gain valuable insight into relevant visualization and interactive processing techniques. Subsurface data has interesting characteristics such as its solid nature, large range of scales and high degree of uncertainty which makes it challenging to visualize with standard methods. It is also noteworthy that parallel fields of research have taken place in geosciences and in computer graphics with different terminology when it comes to representing geometry, describing terrains, interpolating data and example based synthesis of data. The domains covered in this book are geology, digital terrains, seismic data, reservoir visualization and CO₂ storage. The technologies covered are 3D visualization, visualization of large datasets, 3D modelling, machine learning, virtual reality, seismic interpretation and multidisciplinary collaboration. People within any of these domains and technologies are potential readers of the book.
