Abstract: The continuous growth of the world population has led to the constant increase of environmental pollution, with serious consequences for human health. Toxic, non-biodegradable, and recalcitrant organic pollutants (e.g., dyes, pharmaceuticals, pesticides) are discharged into water resources from various industries, such as textiles, leather, pharmaceuticals, plastics, etc. Consequently, the treatment of industrial wastewater, via a sustainable technology, represents a great challenge for worldwide research. Photocatalytic technology, an innovative technique based on advanced oxidation process (AOP), is considered a green technology with promising prospects in the remediation of global environmental issues. In photocatalysis, a very important role is attributed to the photocatalyst, usually a semiconductor material with high solar light absorption capacity and conductivity for photogenerated-charge carriers. Zinc sulfide (ZnS), as n-type semiconductor with different morphologies and band gap energies ($E_g = 3.2\text{--}3.71\text{ eV}$), is recognized as a promising photocatalyst for the removal of organic pollutants from wastewater, especially under UV light irradiation. This review deals with the recent developments (the last five years) in ZnS nanostructures (0D, 1D, 3D) and ZnS-based heterojunctions (n-n, n-p, Z-scheme) used as photocatalysts for organic pollutants' degradation under simulated (UV, Vis) and sunlight irradiation in wastewater treatment. The effects of different synthesis parameters (precursors' type and concentration, capping agents' dosages, reaction time and temperature, metal doping, ZnS concentration in heterostructures, etc.) and properties (particle size, morphology, band gap energy, and surface properties) on the photocatalytic performance of ZnS-based photocatalysts for various organic pollutants' degradation are extensively discussed.

1. Introduction

Wastewater loaded with toxic, non-biodegradable organic pollutants represents a real problem, both for aquatic environments and for human life and development. Industrial wastewater originates mainly from the textile industry, but also from the plastics, paper, food, and cosmetic industries, due to the large amount of water used in the various technological stages, especially during the dyeing process [1]. It has been estimated that the wastewater from textile production contributes approximately 20% of the total industrial polluted water [2].

The presence of a very small concentration of organic dyes in water (less than 1 ppm for some dyes) may have serious consequences for the environment, but more for the population health, such as skin and eyes irritations, respiratory and gastric tracts affections, quadriplegia, tachycardia, tissue necrosis, and cancer [3–4].

The dyes most used industrially are azo dyes (usually with an aromatic structure) which, under natural conditions, require a long time to degrade due to their high photosta-

Nanotechnology is a catch all description of activities at the level of atoms and molecules that have applications in the real world A nanometer is a billionth of a metre about 1 80 000 of the diameter of a human hair or 10 times the diameter of a hydrogen atom Nanotechnology is now used in precision engineering new materials development as well as in electronics electromechanical systems as well as mainstream biomedical applications in areas such as gene therapy drug delivery and novel drug discovery techniques This book presents the latest research in this frontier field *Foundations of Nanotechnology, Volume Two* Sabu Thomas, Saeedeh Rafiei, Shima Maghsoodlou, Arezo Afzali, 2014-10-24 The collection of topics in this book reflects the diversity of recent advances in nanoelements formation and interactions in nanosystems with a broad perspective that is useful for scientists as well as for graduate students and engineers One of the main tasks in making nanocomposites is building the dependence of the structure and shape of the nanoelements forming the basis for the composite of their sizes This is because with an increase or a decrease in the specific size of nanoelements their physical mechanical properties such as the coefficient of elasticity strength and deformation parameter vary by over one order The calculations show that this is primarily due to a significant rearrangement of the atomic structure and the shape of the nanoelement The investigation of the above parameters of the nanoelements is technically complicated and laborious because of their small sizes When the characteristics of powder nanocomposites are calculated it is also very important to take into account the interaction of the nanoelements since the changes in their original shapes and sizes in the interaction process and during the formation of the nanocomposite can lead to a significant change in its properties and a cardinal structural rearrangement In addition the studies show the appearance of the processes of the ordering and self assembling

leading to a more organized form of a nanosystem The above phenomena play an important role in nanotechnological processes They allow nanotechnologies to be developed for the formation of nanostructures by the self assembling method which is based on self organizing processes and building up complex spatial nanostructures consisting of different nanoelements The study of the above dependences based on the mathematical modeling methods requires the solution of the aforementioned problem at the atomic level This requires large computational aids and computational time which makes the development of economical calculation methods urgent The objective of this volume is the development of such a technique in various nanosystems *Advances in Nanostructured Materials for Multifunctional Applications* Luz Stella

Gomez-Villalba,2019 This volume presents the recent research progress in the synthesis characterization techniques properties and interactions of nanostructured materials for multifunctional applications The opportunity to apply singular or hybrid nanomaterials proves to be a constant challenge in order to optimize its use achieving simultaneous results for its application in different branches of research It is focused on the study of structures and their effect on the properties of solids using different experimental techniques and practical applications of nanostructured materials in the context of the latest achievements in the area of research of solid state phenomena Multifunctional Nanomaterials Synthesis Morpho Structural and Chemical Properties Experimental Characterization Techniques Optical Properties Electrical Properties Cultural Heritage Conservation Construction Materials Materials Science **Leading Edge Nanotechnology Research**
