## **Regulation Of Alternative Splicing:**

**Regulation of Alternative Splicing** Philippe Jeanteur,2013-03-14 The discovery in 1977 that genes are split into exons and introns has done away with the one gene one protein dogma Indeed the removal of introns from the primary RNA transcript is not necessarily straightforward since there may be optional pathways leading to different messenger RNAs and consequently to different proteins Examples of such an alternative splicing mechanism cover all fields of biology Moreover there are plenty of occurrences where deviant splicing can have pathological effects Despite the high number of specific cases of alternative splicing it was not until recently that the generality and extent of this phenomenon was fully appreciated A superficial reading of the preliminary sequence of the human genome published in 2001 led to the surprising and even deceiving to many scientists low number of genes around 32 000 which contrasted with the much higher figure around 150 000 which was previously envisioned Attempts to make a global assessment of the use of alternative splicing are recent and rely essentially on the comparison of genomic mRNA and EST sequences as reviewed by Thanaraj and Stamm in the first chapter of this volume Most recent estimates suggest that 40 60% of human genes might be alternatively spliced as opposed to about 22% for C elegans

*Melanogaster* Jefferson Matthew Taliaferro,2012 The patterns and mechanisms by which eukaryotic cells regulate the expression of their genetic information are highly complex and intricate The transmittance of this information from nuclear repository to cytoplasmic translation contains within it several steps including the selective removal and concomitant joining of pieces of information in a process called alternative splicing The projects detailed within this document describe the regulation of alternative splicing through the interaction of specific proteins with specific pre mRNA transcripts The Rio lab has studied PSI a protein involved in the regulation of the P element transposase transcript for many years It has since been shown to regulate the splicing of hundreds of other transcripts The experiments described here look at the organization of PSI and other proteins on the P element transcript by site specific labeling of the transcript using radioactive <sup>32</sup>P We also

investigate two phosphorylation events of PSI identifying the kinases responsible and demonstrate that these events may change the protein protein interaction partners of PSI It has become increasingly apparent that alternative splicing may not only be regulated by protein RNA interactions but also by RNA RNA interactions To probe this we designed experiments to test if some well known small RNA associated proteins are regulating alternative splicing Using splice junction microarrays we determined that Argonaute 2 Ago 2 regulated the splicing of over 100 splice junctions and further experiments using ChIP seq and mRNA seq of Ago 2 mutants revealed that Ago 2 also has a role in transcriptional repression possibly through being incorporating in complexes composed of polycomb group genes We also used CLIP seq to determine the RNA binding profile and preferences of Ago 2 in Drosophila tissue culture cells Finally we characterized the functions of a Drosophila specific splicing factor called LS2 LS2 is orthologous to the highly conserved splicing factor dU2AF50 but its origin through retroduplication and subsequent divergence to acquire distinct sequence specificity expression pattern and function show it to be an interesting case in the evolution of alternative splicing regulation This may be a mechanism that underlies the existence of some members of the large families of splicing factors including hnRNP proteins and SR proteins That is by duplicating functional copies of genes cellular systems create new proteins to tinker with and acquire new functions while keeping the former functionality and stability of the parent protein While these projects are essentially independent of each other they all fall under the umbrella of protein regulation of RNA metabolism and hopefully contribute to a more complete understanding of the regulation of gene expression

**Alternative Splicing in the Postgenomic Era** Benjamin J.

Blencowe, Brenton R. Graveley, 2008-01-23 Yet again Springer has reached the market before everyone This is the first book that is solely dedicated to the topic of alternative splicing The book contains chapters by experts in the field that cover nearly all aspects of this hugely important subject The purpose of the text is to provide a single authoritative source of information on alternative splicing that is accessible to researchers in diverse fields It is suitable for beginners and experts alike

**Investigating the Integration of Alternative Splicing and Transcriptional Regulation in Mammalian Gene Expression** Yuen Yan Joanna Ip, 2011      **Mechanisms for the Regulation of Alternative Splicing** Dimitrios Harvatis, 1996      *Pre-mRNA Architecture and Sequence Element Regulation of Alternative Splicing* William Francis Mueller, 2013 Human genes are split into regions that code for protein exons and regions that don't introns Upon transcription the removal of these intervening introns is necessary if a usable mRNA molecule is to be translated The process of intron removal and subsequent ligation of exons is called splicing and is carried out by a large complex called the spliceosome This process is driven by sequence elements within the pre mRNA itself and is the major contributor of diversity to the human transcriptome Due to the ubiquitous nature of alternative splicing in almost every multi exon gene the regulation pathways of exon inclusion are a subject of wide study The different lengths of introns and exons as well as location of splice sites in a pre mRNA molecule have been shown to have differing effects on the spliceosomes ability to

recognize them Using *emph* in vitro splicing and complex formation assays in parallel with cell transfection experiments we determined that the distance between two splice sites across the intron or across the exon are strong predictors of splice site usage Additionally we found that two splice sites interact differently when placed at different lengths apart Our findings suggest a mechanism for observed selection of specific intron exon architectures Splice site recognition is also influenced by the presence of protein binding sequence elements in the pre mRNA that alter spliceosomal recruitment Previously these proteins and sequence elements had been rigidly classified into splice enhancing or inhibiting categories We show that this rigid classification is incorrect We found that the location of these elements relative to the splice site determines their enhancing or silencing effect That is an enhancing element found upstream of a splice site imposes a silencing effect when relocated downstream of the splice site and vice versa Spliceosomal proteins are conserved from yeast to humans The sequence elements used in pre mRNA sequences have been evolving over time but under pressure from multiple cellular processes including splicing To observe the effect of splicing on evolution we took advantage of the synonymous mutation positions that are under the least amount of selective pressure from the genetic code We mutated these positions and found that some caused a large decrease in exon inclusion When we analyzed the comparative alignment data we found that these specific nucleotide mutations were selected against across species in order to maintain exon inclusion SNP analysis showed that this pattern of selection was broadly observable at synonymous positions throughout the human genome

transcriptional events including alternative splicing and polyadenylation mRNA stability and miRNAs and their involvement in the disease progression are examined in detail Includes full color imagery illustrating key concepts and post transcriptional disease processes as well as descriptions of methods for studying post transcriptional gene regulation Presents fundamental knowledge molecular and biochemical mechanisms and recent findings in concise and easily understandable formats Features a summary and conclusion at the end of each chapter

### **Relevance and Regulation of Alternative Splicing in Plant Heat Stress Response: Current Understanding and Future Directions**

Remus R. E. Rosenkranz, Sarah Ullrich, Karin Löchli, Stefan Simm, Sotirios Fragkostefanakis, 2022 Alternative splicing AS is a major mechanism for gene expression in eukaryotes increasing proteome diversity but also regulating transcriptome abundance High temperatures have a strong impact on the splicing profile of many genes and therefore AS is considered as an integral part of heat stress response While many studies have established a detailed description of the diversity of the RNAome under heat stress in different plant species and stress regimes little is known on the underlying mechanisms that control this temperature sensitive process AS is mainly regulated by the activity of splicing regulators Changes in the abundance of these proteins through transcription and AS post translational modifications and interactions with exonic and intronic cis elements and core elements of the spliceosomes modulate the outcome of pre mRNA splicing As a major part of pre mRNAs are spliced co transcriptionally the chromatin environment along with the RNA polymerase II elongation play a major role in the regulation of pre mRNA splicing under heat stress conditions Despite its importance our understanding on the regulation of heat stress sensitive AS in plants is scarce In this review we summarize the current status of knowledge on the regulation of AS in plants under heat stress conditions We discuss possible implications of different pathways based on results from non plant systems to provide a perspective for researchers who aim to elucidate the molecular basis of AS under high temperatures

Supriya Kumar, 2005 *Alternative Splicing Regulation During Caenorhabditis Elegans Development and Evolution* Sergio Barberan-Soler, 2008 [Links between chromatin structure and regulation of alternative pre-mRNA splicing in mammalian cells](#) Camilla Iannone, 2015 Intron removal is a necessary step for expression of most genes in higher eukaryotes and alternative splice selection is a highly regulated mechanism that endows a single gene with the possibility to codify for multiple transcripts Pre mRNA splicing occurs largely co transcriptionally and its outcome is influenced by transcription elongation and chromatin structure In this thesis we have used two different approaches to study novel links between chromatin structure and alternative splicing regulation In the first approach we identified genome wide progesterone regulated cassette exons and compared them with nucleosome density profiles with the aim of finding correlations between changes in nucleosome positioning and changes in alternative splicing We find that even if all exons harbor a well positioned exonic nucleosome four different classes of nucleosome density profiles can be identified around alternative exons which strongly correlate with the DNA

sequence GC content Transitions between these profiles occur upon hormone stimulation and can be correlated with alternative splicing changes although changes in nucleosome profiles are also observed in non regulated exons In particular hormone induced exon inclusion is more frequently linked to changes in nucleosome density than hormone induced skipped exons which tend to have low nucleosome density profiles even before hormone treatment Peaks of nucleosome density before alternative exons tend to correlate with exon inclusion In the second approach we took advantage of ENCODE data of chromatin epigenetic signatures and RNA Seq in multiple cell lines to evaluate functional enrichment of histone modifications over alternative exons We find that three histone modifications H3K4me3 H3K27ac and H3K9ac co occur in a subset of exons when they are highly included These features are sufficient to predict differential inclusion levels in other cell lines Moreover they are enriched in exons characterized by the presence of DNase hypersensitive sites promoter signatures and RNA Pol II accumulation These observations suggest a functional role for 3 dimensional genome structure in the regulation of alternative splicing
