A Technique for Determining Relaxation Times by Free-flight Tests of Low-fineness-ratio Cones; with Experimental Results for Air at Equilibrium Temperatures Up to 3440 K Jack D. Stephenson, 1960

This report describes a technique which combines theory and experiments for determining relaxation times in gases. The technique is based on the measurement of shapes of the bow shock waves of low fineness ratio cones fired from high velocity guns. The theory presented in the report provides a means by which shadowgraph data showing the bow waves can be analyzed so as to furnish effective relaxation times. Relaxation times in air were obtained by this technique and the results have been compared with values estimated from shock tube measurements in pure oxygen and nitrogen. The tests were made at velocities ranging from 4600 to 12 000 feet per second corresponding to equilibrium temperatures from 35900 R 19900 K to 6200 R 34400 K under which conditions at all but the highest temperatures the effective relaxation times were determined primarily by the relaxation time for oxygen and nitrogen vibrations.

Relaxation In Shock Waves Book Review: Unveiling the Power of Words

In a global driven by information and connectivity, the energy of words has be evident than ever. They have the capability to inspire, provoke, and ignite change.
