Loussouarn, Mounir Tarek, Voltage gated ion channels are transmembrane proteins in which at least one gate is controlled by the transmembrane potential They are frequently very selectively permeable to sodium Nav channels potassium Kv channels or calcium Cav channels ions Depending on the channels opening of the activation gate is triggered by membrane depolarization Kv Nav and Cav channels or hyperpolarization HCN channels for instance In addition in many voltage gated channels a so called inactivation gate is also present Compared to the activation gate the latter is oppositely coupled to the potential In Kv Nav and Cav channels upon membrane depolarization the inactivation gate closes whereas the activation gate opens Depending on the cell types in which they are expressed and their physiological role various voltage dependent

channels can be characterized by their conductance ion selectivity pharmacology and voltage sensitivity These properties are mainly dictated by the amino acids sequence and structure of the pore forming subunit s presence of accessory subunit s membrane composition intra and extracellular ions concentration Noteworthy despite a profound variety of these ion channels characteristics it seems that most of them obey to the same global four fold structure now obtained by several X ray crystallography experiments Given the wealth of electrophysiological biochemical optical and structural data regarding ion channels voltage dependency we decided to put together in this e book up to date reviews describing the molecular details of these complex voltage gated channels **Engineering Fluid Mechanics Workshop Report** Norman H.
