Microprocessor Design Thomas D. Burd, Robert W. Brodersen, 2012-12-06 This work began in 1995 as an outgrowth of the InfoPad project which showed us that in order to reduce the energy consumption of a portable multimedia terminal that something had to be done about the consumption of the microprocessor subsystem The design of the InfoPad attempted to reduce the requirements of this general purpose processor by moving the computation into the network or by the use of highly optimized integrated circuits but in spite of these efforts it still was a major consumer of energy The reasons for this became apparent as we determined that the energy required to perform a function in dedicated hardware could be several orders of magnitude lower than that consumed in the InfoPad microprocessor We therefore set out on a full fledged attack on all aspects of the microprocessor energy consumption 1 J After considerable analysis it became clear that though better circuit design and a stream lined architecture would assist in our goal of energy reduction that the biggest gains were to be found by operating at reduced voltages For the busses and VO this could be accomplished without significant degradation of the processor performance but this was not a straightforward solution when applied to the core of the processor sub system CPU and memory *Parallel Program Development for Cluster Computing* José Cardoso Cunha, Péter Kacsuk, Stephen

Winter, 2001 The book is divided into two parts the first one covering the concepts and methodologies and the second describing the tools and integrated environments that were developed in those projects In this way we hope that the reader will find the book useful not only concerning an identification of current trends in parallel program development but also concerning their practical illustration through concrete tools and environments **Fundamentals of Information**

High-Performance Energy-Efficient Microprocessor Design Vojin G. Oklobdzija, Ram K. Krishnamurthy, 2007-04-27 Microprocessors of today contain close to a billion transistors while achieving the performance of super computers just a decade ago Designing such processors takes hundreds of people organized into large teams High Performance Energy Efficient Microprocessor Design is written by the world s most prominent microprocessor design leaders from the industry and academia It provides a complete coverage of all the aspects of a complex microprocessor design process from technology power management clocking high performance architecture design methodologies memory and I O design computer aided design testing and design for testability The chapters are written to provide the latest state of the art knowledge of particular aspects of microprocessor design while including sufficient tutorial content in order to bring non experts up to speed High Performance Energy Efficient Microprocessor Design is intended to be a useful companion book for every design engineer working in the related areas and a source of technical information as well as a comprehensive reference in the field It should also serve as the source book for technical and business managers involved in microprocessor based design and manufacture The chapters are organized in a way which makes it possible to use this book as a textbook for graduate courses in advanced digital and system design The book is intended to highlight practical problems encountered in designing state of the art processors while yet covering fundamental principles that are independent of technology
