ABSTRACT

The life cycle of tetraphyllid cestodes is complex, involving a diversity of plerocercoid larvae that can utilize teleost fish as a second intermediate host or paratenic host. The objective of this study is the morphological characterization of tetraphyllid plerocercoids in *Trichiurus lepturus* Linnaeus, 1758 from the coast of the state of Rio de Janeiro, Brazil. In July 2018, 33 specimens of *T. lepturus* were obtained from commercial fishermen, captured near the Cagarras archipelago (23°1'52"S, 43°11'56"W), state of Rio de Janeiro, Brazil. The hosts were weighed, measured, and subjected to necropsies under a stereoscopic microscope for the collection of plerocercoids. The collected specimens were fixed and prepared following traditional helminthological techniques. Morphological and morphometric studies of the parasites were conducted, considering the size, body shape, and characteristics of the scolex and bothridia. Four morphotypes of plerocercoids were identified: Morphotype I corresponds to the genus *Phereobothrium* Linton, 1889, Morphotype II to *Trilocularium*
