Mononuclear Phagocyte Biology:

Mononuclear Phagocyte Biology Alvin Volkman, 1984

Dendritic Cell and Macrophage Nomenclature and

Classification Florent Ginhoux, Martin Williams, Shalin Naik, 2016-07-14 The mononuclear phagocyte system MPS comprises dendritic cells DCs monocytes and macrophages M s that together play crucial roles in tissue immunity and homeostasis but also contribute to a broad spectrum of pathologies They are thus attractive therapeutic targets for immune therapy However the distinction between DCs monocytes and M subpopulations has been a matter of controversy and the current nomenclature has been a confounding factor DCs are remarkably heterogeneous and consist of multiple subsets traditionally defined by their expression of various surface markers While markers are important to define various populations of the MPS they do not specifically define the intrinsic nature of a cell population and do not always segregate a bona fide cell type of relative homogeneity Markers are redundant or simply define distinct activation states within one subset rather than independent subpopulations One example are the steady state CD11b DCs which are often not distinguished from monocytes monocyte derived cells and macrophages due to their overlapping phenotype Lastly monocyte fate during inflammation results in cells bearing the phenotypic and functional features of both DCs and M s significantly adding to the confusion In fact depending on the context of the study and the focus of the laboratory a monocyte derived cell will be either be called monocyte derived DCs or macrophages Because the names we give to cells are often associated with a functional connotation this is much more than simple semantics The name we give to a population fundamentally changes the perception of its biology and can impact on research design and interpretation Recent evidence in the ontogeny and transcriptional regulation of DCs and M s combined with the identification of DC and M specific markers has dramatically changed our understanding of their interrelationship in the steady state and inflammation In steady state DCs are constantly replaced by circulating blood precursors that arise from committed progenitors in the bone marrow Similarly some M populations are also constantly replaced by circulating blood monocytes However others tissue M s are derived from embryonic precursors are seeded before birth and maintain themselves in adults by self renewal In inflammation such differentiation pathways are fundamentally changed and unique monocyte derived inflammatory cells are generated Current DC monocyte and M nomenclature does not take into account these new developments and as a consequence is quite confusing We believe that the field is in need of a fresh view on this topic as well as an upfront debate on DC and M nomenclature Our aim is to bring expert junior and senior scientists to revisit this topic in light of these recent developments This Research Topic will cover all aspects of DC monocyte and M biology including development transcriptional regulation functional specializations in lymphoid and non lymphoid tissues and in both human and mouse models Given the central position of DCs monocytes and M s in tissue homeostasis immunity and disease this topic should be of interest to a large spectrum of the biomedical community *Phagocytes and Disease* M.S. Invertebrate Immune Responses E.L. Cooper,2013-06-29 E L Cooper In Volume 23 we considered in seven chapters the basic armamentarium of the invertebrate immune system and its cells as well as an analysis of antigens setting the stage for the initiation of an immune response We studied cell products natural or induced as revealed by nonspecific and specific responses following antigenic challenge such as the pro phenol oxidase system the lytic responses the Ig superfamily and the place this family offers invertebrates and insect hemolymph proteins as candidates for membership At this point these various topics seemed to converge almost to overlap in some instances presenting a challenge as to how to move from one subject to another Chapter 1 in this volume offers the bridge to Volume 23 and its final Chapter 7 This Volume 24 contains contributions pertaining to cell activities and the environment Chapters 1 4 refer specifically to interactions between cells and the integration of cell activities The focus is on a functional immune system with antigenic challenge as a subtopic In Chapters 5 7 the environment is considered from several points of view and the main subtopic here is the result of the consequences of connections and missed signals The internal and external environments are treated revealing what may happen when normal immune responses are interfered with All this is integrated by the consideration of the three great regulatory systems the ever present network that somehow acts as the monitor or control for all incoming and outgoing signals

Myeloid Cells in Health and Disease Siamon Gordon,2020-07-10 The structure functions and interactions of myeloid cells have long been the focus of research and therapeutics development Yet much more remains to be discovered about the complex web of relationships that makes up the immune systems of animals Scientists today are applying genome wide analyses single cell methods gene editing and modern imaging techniques to reveal new subclasses of differentiated myeloid cells new receptors and cytokines and important interactions among immune cells In *Myeloid Cells in Health and Disease* A Synthesis Editor Siamon Gordon has assembled an international team of esteemed scientists to provide their perspectives of myeloid cells during innate and adaptive immunity The book begins by presenting the foundational research of Paul Ehrlich Elie Metchnikoff and Donald Metcalf The following chapters discuss evolution and the life cycles of myeloid cells specific types of differentiated myeloid cells including macrophage differentiation and antigen processing and presentation The rest of the book is organized by broad topics in immunology including the recruitment of myeloid and other immune cells following microbial infection the role of myeloid cells in the inflammation process and the repair of damaged tissue the vast arsenal of myeloid cell secretory molecules including metalloproteinases tumor necrosis factor histamine and perforin receptors and downstream signaling pathways that are activated following ligand receptor binding roles of myeloid cells during microbial and parasite infections contributions of myeloid cells in atherosclerosis myeloid derived suppressor cells in tumor development and cancer *Myeloid Cells in Health and Disease* A Synthesis will benefit graduate students and researchers in immunology hematology microbial pathogenesis infectious disease pathology and pharmacology Established
