   Monotone Operators in Banach Space and Nonlinear Partial Differential Equations ,2004   **Monotone Operators in Banach Space and Nonlinear Partial Differential Equations** R. E. Showalter,2013-02-22 The objectives of this monograph are to present some topics from the theory of monotone operators and nonlinear semigroup theory which are directly applicable to the existence and uniqueness theory of initial boundary value problems for partial differential equations and to construct such operators as realizations of those problems in appropriate function spaces A highlight of this presentation is the large number and variety of examples introduced to illustrate the connection between the theory of nonlinear operators and partial differential equations These include primarily semilinear or quasilinear equations of elliptic or of parabolic type degenerate cases with change of type related systems and variational inequalities and spatial boundary conditions of the usual Dirichlet Neumann Robin or dynamic type The discussions of evolution equations include the usual initial value problems as well as periodic or more general nonlocal constraints history value problems those which may change type due to a possibly vanishing coefficient of the time derivative and other implicit evolution equations or systems including hysteresis models The scalar conservation law and semilinear wave equations are briefly mentioned and hyperbolic systems arising from vibrations of elastic plastic rods are developed The origins of a representative sample of such problems are given in the appendix   Nonlinear Partial Differential Equations with Applications Tomáš Roubíček,2013-01-13 This book primarily concerns quasilinear and semilinear elliptic and parabolic partial differential equations inequalities and systems The exposition leads the reader through the general theory based on abstract pseudo monotone or accretive operators as fast as possible towards the analysis of concrete differential equations which have specific applications in continuum thermo mechanics of solids and fluids electrically semi conductive media modelling of biological systems or in mechanical engineering Selected parts are mainly an introduction into the subject while some others form an advanced textbook The second edition simplifies and extends the exposition at particular spots and augments the applications especially towards thermally coupled systems magnetism and more The intended audience is graduate and PhD students as well as researchers in the theory of partial differential equations or in mathematical modelling of distributed parameter systems The monograph contains a wealth of material in both the abstract theory of steady state or evolution equations of monotone and accretive type and concrete applications to nonlinear partial differential equations from mathematical modeling The organization of the material is well done and the presentation although concise is clear elegant and rigorous this book is a notable addition to the existing literature Also it certainly will prove useful to engineers physicists biologists and other scientists interested in the analysis of nonlinear differential models of the real world Mathematical Reviews
