

disorders of man. This has been brought about, in part, by modern therapy which paves the way for opportunistic infections which are often fungal, and also by the description of new mycotic infections, such as subcutaneous phycomycosis.

Each chapter in this book considers the epidemiology of one group of mycotic infections, and there is information on their world distribution, ecological factors for fungal growth and spread, host-parasitic relationships, and some clinical and diagnostic features. The clinical features of *Candida* infections, a common complication of heart surgery and organ transplantation, are described in more detail. The bibliography is extensive and the book will be a valuable reference source for laboratory workers, physicians, and epidemiologists who encounter mycological problems.

**Studies of the Hypothalamus and the Pituitary Gland. With Special Reference to the Effects of Transection of the Pituitary Stalk.** By Peter M. Daniel and Marjorie M. L. Pritchard. (Pp. 216; 104 figures; £3.00.) Oxford: Alden Press. 1975. (First published in 1975 as a Supplement to *Acta Endocrinologica (Copenhagen)*. Suppl 201, accompanying vol 80).

Against a background of their own research over a period of 25 years, and that of their associates, the authors spell out the progress that has been made in our knowledge of the relationship between the hypothalamus and the pituitary gland. The first chapter is wisely devoted to nomenclature.

This monograph should have wide appeal because of the well-conceived chapters on the anatomy of the hypothalamus and the pituitary gland in man and in some animals. For the specialized reader, there is a lucid summary of the more important contributions to literature concerned with lesions, naturally-occurring and experimental, which involve the pituitary stalk. Local and remote effects of its section are considered separately, and the far-reaching implications of the damage are considered from the point of view of potential therapeutic procedures. The authors draw attention to the importance of the hypophyseal portal vessels in specific segments of the neural component of the pituitary gland: two groups of these vessels are now recognized, which is of significance in regard to the secretion of hormones.

There is an extensive bibliography and a useful technical appendix. The varied and plentiful illustrations are of a high order, in keeping with the fine quality of the publication.

**Pathobiology Annual, Volume 5, 1975.** Edited by Harry L. Joachim. (Pp. x + 426; illustrated; £18.50.) Hemel Hempstead: Prentice-Hall International. 1975.

This volume is a welcome indication of the catholic approach to pathology with significant blurring of the boundaries between individual disciplines. The articles, all of which are informative and most of which are clearly written and illustrated, range in subject matter from the Morphology of Coronary Artery Disease to an interesting discussion of the Sleep-Dream Cycle. W. M. Thuribeck contributes a scholarly paper on Lung Growth and Alveolar Multiplication and brings new, if controversial, ideas to the field of disordered lung growth in human disease. There are informative articles, with much new data, on Cancer and Host Defence Mechanisms and on Mechanisms of Tissue Injury in Systemic Lupus Erythematosus. If these subjects seem rather obscure the practising clinical pathologist will find them intellectually stimulating and he can gain consolation and practical support from the sections on Haemopoietic Stem Cells by E. K. Cronkite, Cytomegalovirus Pulmonary Disease by J. E. Craighead, and The Pathology of the Liver in Haemochromatosis by L. W. Powell and J. F. R. Kerr. The chapter on the Mode of Action of Steroid Hormones and on Enzymes in Myocardial Infarction will prove of interest to all pathologists and not just to biochemists.

Dr Joachim is to be congratulated on bringing together a distinguished and varied collection of reviews, and one looks forward eagerly to the next Annual—even at this price.

**Biochemical Tests for Identification of Medical Bacteria.** By Jean F. MacFaddin. (Pp. xii + 312; illustrated; \$12.75.) Baltimore: Williams and Wilkins. 1976.

This book contains the methods, media, and biochemical principles of 29 common biochemical tests used for medical bacteria together with illustrations of the un-

inoculated media and of positive and negative reactions. There is also a short account of multitest systems (particularly API and PathoTec), and identification schemes for the various groups of medically important bacteria are presented. This book will inevitably be compared with *Cowan and Steel's Identification of Medical Bacteria* (Cowan, S. T. (1974) 2nd ed. Cambridge University Press) with which it compares unfavourably in the range of tests covered. The present book is not sufficiently comprehensive for a bench manual as many commonly used tests are omitted, for example, starch hydrolysis and ammonium salt sugars, and a great deal of space is wasted by unnecessary descriptions of many varieties of the tests given. There are inaccuracies and omissions throughout the text; for example, taken at random it is stated on page 3 that all pseudomonads give an oxidative reaction in the O/F test, and on page 33 there is no mention of the use of 'chocolate' blood agar in tests for catalase for fastidious organisms.

The identification tables and sequential keys also compare unfavourably with the tables in Cowan and Steel, but the author is to be congratulated on the extremely useful explanations of the biochemical principles underlying each test, and the coloured illustrations may prove useful to those unfamiliar with the tests described.

### Platelets: a multidisciplinary approach

An international symposium on Platelets: a Multidisciplinary Approach will be held in Florence on 28-30 September 1977. The aim of this symposium is to focus attention on platelets both as a model in pharmacology, biochemistry, immunology, inflammation, and related fields and as a cell involved in physiopathological phenomena not directly connected with haemostasis and mechanisms of thrombosis.

**Pathology Annual** Sheldon C. Sommers, 1975-01-01 Pathology of AIDS Harry L. Joachim, 1989 Radiotherapy, Surgery, and Immunotherapy Frederick Becker, 2012-12-06 The history of the development of cancer therapy has been marked by a recurring pattern one of initially exciting and encouraging results as new methods were introduced followed by dismaying failures The extremity of the disease and its high mortality have dictated that each means of damaging tumor cells would be rapidly explored and exploited as a mode of therapy long before the corresponding theory and technique were completely understood and perfected Thus radiation was used as an antitumor agent almost immediately following recognition of its cytodestructive capability Equally constant following the rapid utilization of new therapeutic methods has been a period of significant technical improvements This second aspect of the pattern is also illustrated by the field of radiotherapy New radiation sources new methods of dosimetry use of high energy radiation and other new techniques allowed the therapist to better focus upon the tumor and to improve the geometry of exposure Thus with each technical advance the reach of radiotherapy was increased and damage to normal tissues was

decreased. Inevitably, however, a limit was reached, a point at which clinicians and researchers realized they could go no further without returning to a more fundamental search, one based on the biology of the tumor cell itself. **Biopsy**

**Pathology of the Bronchi** Elizabeth M. McDowell, Theodore F. Beals, 2013-12-20. *Biopsy Pathology of the Bronchi* is intended to provide the practicing pathologist with a convenient source of diagnostic information combined with pertinent clinical patterns and a background of histogenesis. It is hoped that the book will facilitate the accuracy of diagnosis, minimize pitfalls of interpretation, and assist in the rapid evaluation of acute and chronic bronchial lesions, including neoplasms. Biopsy is taken in the widest sense, and the book includes discussions on cytology, microbiopsies, fine needle aspiration biopsies, curette samples, and biopsies obtained by microforceps and macrobiopsies obtained at the time of surgery. Part I of the book deals with the procurement and preparation of bronchial specimens and includes a chapter on fetal development and structure of the normal adult epithelium. In Part II, the histopathology of numerous bronchial diseases is described in detail. Emphasis is placed on the diagnostic features of human lesions, which are illustrated by numerous high-quality light and electron micrographs. Understanding normal bronchial structure, cell kinetics, and modulations of phenotypic expression provide insight into many pathological processes. Therefore, although emphasis is placed on the diagnostic features of human disease, the histopathology of corresponding lesions in experimental animals is discussed, where this provides information helpful in the interpretation of the human lesions. Ultrastructural Pathology of the Cell and Matrix Feroze N. Ghadially, 2013-10-22. *Ultrastructural Pathology of the Cell and Matrix*, Third Edition, Volume I, presents a comprehensive examination of the intracellular lesion. It discusses the analysis of pathological tissues using the electron microscope. It addresses the experimental procedures made on the cellular level. Some of the topics covered in the book are the physiological analysis of the nucleus, nuclear matrix, interchromatin, and perichromatin granules; structure and function of centrioles; characteristics of mitochondria; Golgi complex in cell differentiation and neoplasia; and degranulation of rough endoplasmic reticulum. The intracytoplasmic and intranuclear annulate lamellae are fully covered. An in-depth account of the classification, history, and nomenclature of lysosomes are provided. The morphology and normal variations of melanosomes and anchoring fibrils are completely presented. A chapter is devoted to the endocytotic structures and cell processes. Another section focuses on the classification and nomenclature of fibrous components. The book can provide useful information to cytologists, scientists, students, and researchers.

The Cerebral Veins L.M. Auer, F. Loew, 2013-12-11. Research in the morphology, angioarchitecture, and ultrastructure of cerebral veins has been widely neglected in past decades; investigation was mainly focussed on the arterial side of brain circulation. This circumstance has certainly had a negative impact on the development of knowledge in clinical medicine about cerebral venous disease. Cerebral venous pathology and its consequence is, however, a frequent problem in clinical neurosurgery, both

with regard to operative techniques and conservative management Therefore it is not surprising that the initiative to collect for the first time data on our present knowledge in basic research of cerebral veins their structure and function under normal and pathological circumstances came from clinicians Regarding the cerebral veins the clinician has primarily in view the dysfunctions originating from embryogenetic malformations phlebitic obstruction tumorous shunts or traumatic lesions But in addition to that particular attention should be paid to the microstructure of the venous vessel walls their barrier function and the venous vasomotor system Studying these interrelationships has for a long time been both fascinating and of immediate interest to me

**Cancer Markers** Stewart Sell, 2012-12-06 Developmental cancer products oncodevelopmental markers ODM not only serve as diagnostic and prognostic indicators but also may be used to study the nature of the carcinogenic process and the biology of tumors For many years oncologists have searched for markers of cancer cells that would permit unequivocal recognition of cancer in contrast to noncancerous tissue The earliest and still most widely used method of identification of cancer tissue or cells is the structural resemblance of cancer tissue to fetal or immature tissue Pathologists not only recognize cancer by its morphologic similarity to fetal tissues but also in many instances can relate the behavior of a given tumor to the degree of tissue differentiation Thus poorly differentiated tumors that resemble fetal tissue generally grow more rapidly and metastasize earlier than do well differentiated tumors that more closely resemble adult tissue In recent years the commonality of fetal and cancer tissue has been extended to products of tumor cells that can be analyzed by biochemical immunological or physiological techniques Increasingly products of cancer cells similar to fetal products are being identified and studied These products range from cell surface markers fetal or differentiation antigens placental proteins hormones and isoenzymes to a multitude of products such as carcinoembryonic antigen CEA alphafetoprotein AFP lymphocyte markers and nucleic acids such as tRNA that are produced in small amounts by v vi
