Pathways to Co-operation Dot Walker, Pamela Brown, 1994. Strategies following eight guidelines for cooperative learning in primary school with 25 simple activities and games.

Cognitive Science Harald Maurer, 2021-07-08. The Mind and Brain are usually considered as one and the same nonlinear complex dynamical system in which information processing can be described with vector and tensor transformations and with attractors in multidimensional state spaces. Thus an internal neurocognitive representation concept consists of a dynamical process which filters out statistical prototypes from the sensorial information in terms of coherent and adaptive n -dimensional vector fields. These prototypes serve as a basis for dynamic probabilistic predictions or probabilistic hypotheses on prospective new data. See the recently introduced approach of predictive coding in neurophilosophy. Furthermore, the phenomenon of sensory and language cognition would thus be based on a multitude of self-regulatory complex dynamics of synchronous self-organization mechanisms. In other words, an emergent flux equilibrium process, steady state of the total collective and coherent neural activity resulting from the oscillatory actions of neuronal assemblies. In perception, it is shown how sensory object informations like the object color or the object form can be dynamically related together or can be integrated to a neurally based representation of this perceptual object by means of a synchronization mechanism, feature binding. In language processing, it is shown how semantic concepts and syntactic roles can be dynamically related together or can be integrated to neurally based systematic and compositional connectionist representations by means of a synchronization mechanism, variable binding, solving the Fodor-Pylshyn Challenge. Since the system-theoretical connectionism has succeeded in modeling the sensory objects in perception as well as systematic and compositional representations in language processing with this vector and oscillation-based representation format, a new convincing theory of neurocognition has been developed which bridges the neuronal and the cognitive analysis level. The book describes how elementary neuronal information is combined in perception and language so it becomes clear how the brain processes this information to enable basic cognitive performance of the humans.

Logistics Outsourcing Relationships Jan M. Deepen,2007-06-13 In recent years logistics outsourcing has gained increasing importance and today is used by a large number of firms across virtually all industries worldwide Logistics service providers have developed a wide array of services that are utilized to improve logistics processes and mainly to cut costs This book uses state of the art scientific methods to reveal that most firms currently do not realize the full potential of logistics outsourcing It shows the complexity of outsourcing performance and that its true drivers lie in the relationship between service providers and their customers Through the results of a large scale empirical survey the book also emphasizes the importance of a firm s approach towards outsourcing solely striving for cost reductions may be a dead end while the often overlooked increased logistics service levels are equally important for boosting logistics performance In the light of current outsourcing practices this indicates substantial room for improvement for most firms
