Dielectric Materials for Wireless Communication Mailadil T. Sebastian,2010-07-07 Microwave dielectric materials play a key role in our global society with a wide range of applications from terrestrial and satellite communication including software radio GPS and DBS TV to environmental monitoring via satellite A small ceramic component made from a dielectric material is fundamental to the operation of filters and oscillators in several microwave systems In microwave communications dielectric resonator filters are used to discriminate between wanted and unwanted signal frequencies in the transmitted and received signal When the wanted frequency is extracted and detected it is necessary to maintain a strong signal For clarity it is also critical that the wanted signal frequencies are not affected by seasonal temperature changes In order to meet the specifications of current and future systems improved or new microwave components based on dedicated dielectric materials and new designs are required The recent progress in microwave telecommunication satellite broadcasting and intelligent transport systems ITS has resulted in an increased demand for Dielectric Resonators DRs With the recent revolution in mobile phone and satellite communication systems using microwaves as the propagation media the research and development in the field of device miniaturization has been a major challenge in contemporary Materials Science In a mobile phone communication the message is sent from a phone to the nearest base station and then on via a series of base stations to the other phone At the heart of each base station is the combiner filter unit which has the job of receiving the messages keeping them separate amplifying the signals and sending then onto the next base station For such a microwave circuit to work part of it needs to resonate at the specific working frequency The frequency determining component resonator used in such a high frequency device must satisfy certain criteria The three important characteristics required for a dielectric resonator are a a high dielectric constant which facilitates miniaturization b a high quality factor Q_{xf} which improves the signal to noise ratio c a low temperature coefficient of the resonant frequency which determines the stability of the transmitted frequency During the past 25 years scientists the world over have developed a large number of

new materials about 3000 or improved the properties of known materials About 5000 papers have been published and more than 1000 patents filed in the area of dielectric resonators and related technologies This book brings the data and science of these several useful materials together which will be of immense benefit to researchers and engineers the world over The topics covered in the book includes factors affecting the dielectric properties measurement of dielectric properties important low loss dielectric material systems such as perovskites tungsten bronze type materials materials in BaO TiO₂ system Zr Sn TiO₄ alumina rutile AnBn 1O3n type materials LTCC ceramic polymer composites etc The book also has a data table listing all reported low loss dielectric materials with properties and references arranged in the order of increasing dielectric constant Collects together in one source data on all new materials used in wireless communication Includes tabulated properties of all reported low loss dielectric materials In depth treatment of dielectric resonator materials

Synthesis, Crystal Growth and Characterization K. Lal, 2012-12-02 Synthesis Crystal Growth and Characterization presents the proceedings of the International School on Synthesis Crystal Growth and Characterization of Materials for Energy Conversion and Storage held on October 12-23 1981 at the National Physical Laboratory in New Delhi India The book consists of lectures by distinguished scientists from around the world who tackle different aspects of synthesis crystal growth characterization of materials energy conversion and energy storage Organized into four parts encompassing 26 chapters the book begins with an overview of the synthesis of materials at high temperatures and pressures before turning to a discussion of how macrocrystalline and amorphous silicon is prepared It then looks at fundamental principles underlying the process of crystal growth both from the vapor phase and from melt and methodically introduces the reader to the different techniques used to characterize materials including neutron scattering and electron transport The next chapters focus on point defects and aggregates that influence the critical electronic properties of semiconducting materials X ray diffraction studies of strains and stresses in thin films used in solid state devices and electron spectroscopic studies of solid surfaces The book also considers the role of physics in microelectronics and vice versa fast ion transport in solids and the concept of Syadvada in relation to modern physics This volume is a valuable resource for participants of the International School on Synthesis Crystal Growth and Characterization of Materials for Energy Conversion and Storage as well as active researchers working in areas related to the field
