Case-Based Reasoning in Design Mary Lou Maher, M. Bala Balachandran, Dong Mei Zhang, 2014-02-25 Case based reasoning in design is becoming an important approach to computer support for design as well as an important component in

understanding the design process Design has become a major focus for problem solving paradigms due to its complexity and open ended nature This book presents a clear description of how case based reasoning can be applied to design problems including the representation of design cases indexing and retrieving design cases and the range of paradigms for adapting design cases With a focus on design this book differs from others that provide a generalist view of case based reasoning This volume provides two important contributions to the area a general description of the issues and alternatives in applying case based reasoning to design and a description of specific implementations of case based design Through this combination the reader will learn about both the general issues and the practical problems in supporting design through case based reasoning This book was prepared to fill a gap in the literature on the unique problems that design introduces to computational paradigms developed in computer science It also addresses the needs of computational support for design problem solving from both theoretical and practical perspectives *Case-Based Reasoning Research and Development* Rosina O. Weber, Michael M. Richter, 2007-08-15 The refereed proceedings of the 7th International Conference on Case Based Reasoning are presented in this volume Fifteen full research papers and eighteen poster papers are presented along with three invited talks The papers address all aspects of case based reasoning featuring original theoretical research applied research and applications with practical social environmental and economic significance The Mental Representation of Trait and Autobiographical Knowledge About the Self Thomas K. Srull, Robert S. Wyer, Jr., 2015-12-03 If there is one topic on which we all are experts it is ourselves Psychologists depend upon this expertise as asking people questions about themselves is an important means by which they gather the data that provide much of the evidence for psychological theory Personal recollections play an important role in clinical theorizing people s thoughts feelings and beliefs provide the principal data for attitudinal research and judgments of one s traits and descriptions of one s goals and motivations are essential for the study of personality Yet despite their long dependence on self report data psychologists know very little about this basic resource and the processes that govern it In spite of the importance of the self as a concept in psychology virtually no empirically tested representational models of self knowledge can be found Recently however several theoretical accounts of the representation of self knowledge have been proposed These models have been concerned primarily with the factors underlying a particular type of self knowledge our trait conceptions of ourselves The models all share the starting assumption that the source of our knowledge of the traits that describe us is memory for our past behavior The lead article in this volume reviews the available models of the processes underlying trait self descriptiveness judgments Although these models appear quite different in their basic representational assumptions exemplar and abstraction models sometimes are difficult to distinguish experimentally Presenting a series of studies using several new techniques which the authors believe are effective for assessing whether people recruit specific exemplars or abstract trait summaries when making trait judgments about themselves they conclude that specific behavioral exemplars play a far smaller role in the

representation of trait knowledge than previously has been assumed Finally the limitations of social cognition paradigms as methods for studying the representation of long term social knowledge are discussed and the implications of the research for both existing and future social psychological research are explored

Subsymbolic Natural Language Processing Risto Miikkulainen, 1993 Risto Miikkulainen draws on recent connectionist work in language comprehension to create a model that can understand natural language Using the DISCERN system as an example he describes a general approach to building high level cognitive models from distributed neural networks and shows how the special properties of such networks are useful in modeling human performance In this approach connectionist networks are not only plausible models of isolated cognitive phenomena but also sufficient constituents for complete artificial intelligence systems Distributed neural networks have been very successful in modeling isolated cognitive phenomena but complex high level behavior has been tractable only with symbolic artificial intelligence techniques Aiming to bridge this gap Miikkulainen describes DISCERN a complete natural language processing system implemented entirely at the subsymbolic level In DISCERN distributed neural network models of parsing generating reasoning lexical processing and episodic memory are integrated into a single system that learns to read paraphrase and answer questions about stereotypical narratives Miikkulainen's work which includes a comprehensive survey of the connectionist literature related to natural language processing will prove especially valuable to researchers interested in practical techniques for high level representation inferencing memory modeling and modular connectionist architectures Risto Miikkulainen is an Assistant Professor in the Department of Computer Sciences at The University of Texas at Austin
