ABSTRACT

This research outlines how macroeconomic policies and actions can contribute to environmental sustainability while achieving stable economic growth. The problem is that uncontrolled economic growth and lack of attention to the environment have resulted in significant negative impacts, such as climate change and ecosystem degradation. The aim of this research is to explore the integration of environmental factors in development strategies and economic growth. This research method involves literature analysis, environmental impact assessment, and tracking sustainable macroeconomic policies. The research results show that environmental integration in macroeconomics is the key to achieving sustainable economic growth. This involves the use of strict environmental regulations, development of sustainable economic sectors, investment in technological innovation, and cooperation with the private sector. In conclusion, the integration of the environment in development strategies and economic growth brings economic and environmental benefits. In facing ongoing macroeconomic challenges, balanced policies between economic and environmental interests are needed to achieve sustainable development goals.

INTRODUCTION

Steady economic growth has long been a key focus for countries around the world. However, in efforts to achieve sustainable economic growth, environmental aspects are often ignored or placed on a lower priority. As a result, increased economic growth often comes with serious negative impacts on the environment, such as ecosystem degradation, air and water pollution, and increasingly severe climate change (Erwan Agus Purwanto, 2017). This has caused global concern about the future of the earth and the well-being of future generations.

Sustainable Development: Concepts, Rationalities and Strategies Sylvie Faucheux, Martin O'Connor, Jan van der Straaten, 2013-03-14 3 decision support techniques that do not depend exclusively on market incentives and monetary valuation The World Conservation Strategy published by the mCN 1980 recognised the full dimensions of these problems and introduced the concept of sustainable development placing the emphasis on the exploitation of natural systems and the use of biological natural resources within limits so that the availability of these resources for use by future generations would not be jeopardised by the current use of them At this time the imposition of quotas and the definition of critical loads and environmental standards were suggested as the sorts of instruments necessary to cope with the problems of limited availability of environmental resources Although the mCN publication did not obtain a high international profile the idea of policy norms to respect critical loads has become quite widely accepted in the environmental policymaking of Western countries This has often put the policy agencies in difficult situations Polluting industries are inclined to argue that the critical loads are defined too restrictively The complexity and time lags of ecological effects makes it hard to say exactly what constitutes a critical load beyond which there will be irreversible damage and lobbying interests can play on these uncertainties to try and weaken the environmental standards In addition polluting industries can use the argument of negative impacts on the economy particularly as regards employment and export prospects to blackmail governments regulatory agencies and the general public

Empirical Studies of Environmental Policies in Europe John W. Maxwell, Jürgen von Hagen, 2012-12-06 John W Maxwell and Jiirgen von Hagen Kelley School of Business Indiana University ZEI University of Bonn Indiana University and CEPR Prior to the 1970 s economic studies of the natural environment were chiefly concerned with the optimal extraction of natural resources such as oil coal and timber This focus reflected the commonly held belief that the

natural environmental was sufficient to sustain the world's population in relative comfort at least in developed nations and was there for the taking. By the late 1960s however the spectacular levels of economic growth that had taken place since the Second World War began to exact a visible toll on the natural environment. This visibility prompted growing concern for the environment among activists, government officials, academics and the public. This concern has followed a general upward though cyclic trend to the present day. Remarkable events during this trend include the issuing of the Brundtland report and the world environmental summits held in Rio and Kyoto. Concern for the natural environment has impacted the discipline of economics resulting in the birth of the field of environmental economics that has recently eclipsed in popularity its parent field of natural resource economics.
